Annual Report South Beach Water System

located in Golden Ears Provincial Park

for the period:

January 1, 2023 to December 31, 2023

This water system is owned by:

The BC Ministry of Environment and Climate Change Strategy

and operated by:

Alouette Park Management Ltd.

Questions or requests for further information about this report should be directed to:

Alouette Park Management Ltd.

PO Box 206 Maple Ridge, BC V2X 7G1 (604) 466-8325

office@alouetteparks.ca

This report was prepared on: March 20, 2024

This annual report contains a summary of Bacteriological Water Quality Results for the South Beach Water System during the period described above, and any other information required by the Environmental Health Officer.

Reporting Period: January 1st to December 31st, (year) Water System Water System Owner Primary Contact Name (operator or Manager) Phone Number (operator or Manager) E-mail (operator or Manager) DESCRIBE YOUR WATER SUPPLY SYSTEM What is the Source(s) of Raw Water? Alouette Park Management Ltd. Emergency Response & Contingency Plan Golden Ears Provincial Park Water Systems

Water System Name: Golden Ears Provincial Park - South Beach Day Use Area

Date Completed/Revised: March 22, 2023

EMERGENCY PROCEDURES

Bacterial Contamination of Water Supply - E. Coli

In the event of bacterial contamination of the water system by E. Coli bacteria, the following steps shall be taken:

- 1. Contact Fraser Health (FH) Environmental Health Officer for consultation.
- 2. Notify water system Level II Operator.
- 3. Issue FH Approved Boil Water Notice by posting signs at all water taps, both at standpipes at beach area and Alouette Group Campgrounds, and in washrooms.
- 4. Investigate any recent changes to the water system, including assessing the condition of wellhead, pressure tanks, water quality (colour, turbidity), and water pressure.
- 5. Contact appropriate services for maintenance/repair of the water system. Take any corrective action required. Record actions taken in water system log book.
- 6. Resample water supply upon consultation with Environmental Health Officer.
- 7. Further action may be required pending resampling results.
- 8. Boil Water Advisory is to continue until 2 sample results taken not less than 24 hours apart are negative for both E. Coli and total coliform. Environmental Health Officer must provide verbal or written approval prior to rescinding Boil Water Advisory, and written approval must be obtained later if verbal approval is given first.

Note: If Park Operator (PO) is not able to contact staff from Fraser Health, PO must issue "Boil Water Notice" immediately.

Bacterial Contamination of Water Supply - Total Coliform

In the event of bacterial contamination of the water supply by coliform:

- 1. Contact Fraser Health Environmental Health Officer for consultation
 - a. If positive sample is one of consecutive positive samples, or if high number of totals detected in sample, then a Boil Water Notice may be required to be issued.
 - b. If sample is single isolated positive result then disinfection of water system may be required followed by resampling after chlorine from disinfection has been flushed out of system.
- 2. Notify water system Level II Operator.
- 3. If required, FH Approved Boil Water Notice by posting signs at all water taps, both at standpipes at beach area and Alouette Group Campgrounds, and in washrooms.
- 4. Investigate any recent changes to the water system, including assessing the condition of wellhead, pressure tanks, water quality (colour, turbidity), and water pressure.
- 5. Notify water system Operator:
- 6. Contact appropriate services for maintenance/repair of the water system. Take any corrective action required. Record actions taken in water system log book.
- 7. Resample water supply upon consultation with Environmental Health Officer.
- 8. Further action may be required pending resampling results.
- 9. Boil Water Advisory is to continue until 2 sample results taken not less than 24 hours apart are negative for both E. Coli and total coliform. Environmental Health Officer must provide verbal or written approval prior to rescinding Boil Water Advisory, and written approval must be obtained later if verbal approval is given first.

Chemical or Unknown Contaminant Entering the Water Supply

In the event of an occurrence that could potentially contaminate a water system accidentally, or a chemical or unknow contaminant has entered the water supply, the PO in direct responsibility charge shall immediately take the following steps:

- 1. Contact Fraser Health Environmental Health Officer for consultation. Extensive testing of the water quality may be required.
- 2. Issue a "Flush Only" notice to all users of the water system.
- Water may only be used for flushing toilets and may not be used for human consumption, food preparation or sanitation purposes until the contaminant is removed from the water system.
- 4. Investigates any possible sources of contaminant.
- 5. Take any corrective action required from the investigation. Record actions taken in water system log book.
- 6. Resample water supply upon consultation with Fraser Health Environmental Health Officer.
- 7. If contamination is still detected, then continue to investigate the source of the contamination and take corrective action as required.
- 8. If contaminant is no longer detected, consult with Fraser Health Environmental Health Officer to determine when the "Flush Only" notice can be rescinded.
- 9. Note: If PO not able to contact staff from Fraser Health PO must issue a notice to users of the water system immediately.
- 10. Report the occurrence to BC Parks. Refer to Park Emergency Call-Out List.
- 11. Report occurrence to water system Operator:
- 12. Document all relevant facts and circumstances on the BC Parks Complaint Occurrence Form.

Loss of Water Source (Pump failure or power failure)

- 1. Turn off pump in the pump house.
- 2. Shut down all outside water sources (standpipes).
- 3. Shut down all inside water sources (sinks).
- 4. Turn off tap at standpipes, and put up appropriate signage ("Do Not Use") on standpipes.
- 5. Notify all Park staff.
- 6. Notify all users of the problem.
- 7. Notify the Fraser Health Environmental Health Officer, Alouette Park Management Ltd. senior management, water system Operator and B.C. Parks Area Supervisor.
- 8. Contact outside agencies for advice and assistance if necessary.
- 9. Once problem is solved, restart water system following instructions from Fraser Health, take water samples and send in for testing.
- 10. Take down signs once given approval by Environmental Health Officer.
- 11. Document all events on BC Parks Complaint/Occurrence Report. Provide copies to BC Parks and Fraser Health Authority.

Broken Water Main

- 1. Reduce pressure (but maintain enough pressure to prevent backflow of water).
- 2. Call appropriate contact for repairs. Record actions taken in water system log book.
- 3. Notify users of interruption of service (i.ie. duration of interruption, corrective actions being taken) by posting notices at standpipes and washrooms.
- 4. Notify Fraser Health Environmental Health Officer and water system Operator.

Criminal Tampering

In the event of suspected criminal tampering with a water system, the PO in direct responsibility charge shall immediately take the following steps:

- 1. Turn off the water system, and do not turn it back on without consultation with the Fraser Health Environmental Health Officer. Follow all procedures required by FH.
- 2. Report the occurrence to the Royal Canadian Mounted Police. Phone 911
- 3. Report the occurrence to water system Operator
- 4. Report the occurrence to BC Parks. Refer to Park Emergency Call-Out List.
- 5. Document all relevant facts, evidence and circumstances on the BC Parks Complaint Occurrence Form. Record actions taken in water system log book.

Other Threats to the Drinking Water Supply

- If PO staff become aware of any situation or emergency which may cause a threat to the water supply, immediately nofity Fraser Health Environmental Health Officer and water system Operator
- 2. Notify all users of the threat to the water supply.
- 3. Record actions taken in water system log book.

Water System Turn Off Procedures

- 1. Turn off pump in the pump house.
- 2. Shut down all outside water sources (standpipes at beach and Alouette Group Campground).
- 3. Shut down all inside water sources (sinks). Put up appropriate signage ("Do Not Use") on standpipes and sinks.
- 4. Notify all Park staff.
- 5. Notify all users of the problem.
- 6. Notify the Fraser Health Environmental Health Officer, Alouette Park Management Ltd. senior management, and B.C. Parks Area Supervisor.
- 7. Contact outside agencies for advice and assistance if necessary.
- 8. Once problem is solved, refill water system if drained; take water samples and send in for testing.
- 9. Take down signs once given approval from Fraser Health Authority.
- 10. Document all events on BC Parks Complaint/Occurrence Report. Provide copies to BC Parks and Fraser Health Authority.

BOIL WATER NOTICE

Warning: Boil or Otherwise Treat Your Water Before Using

Date Issued:
The South Beach water system supplying this area has been contaminated with potentially harmful bacteria. E. Coli bacteria were found in the water supply on

WHAT SHOULD I DO?

- DO NOT DRINK the water without BOILING FIRST or otherwise treating the water.
- Boil water for 1 minute (rolling boil). Prefereably use a kettle so as to reduce the risk of burns. Let it COOL before using.
- · You can choose to use Bottled Water
- Boiled or bottled water should be used for DRINKING, COOKING, BRUSHING TEETH, WASHING READY-TO-EAT FOODS AND WASHING DISHES.
- Store treated water in sanitary containers and keep refrigerated.

OTHER METHODS OF TREATING YOUR WATER

- CHLORINE: Household bleach (5%): Add 2 drops per liter and let stand for 30 minutes
- If water is cloudy or cold add 4 drops per liter.
 IODINE/CHLORINE TABLETS: see manufacturers' directions
- Note: Brita Water Filters will NOT provide treatment for microbes.

WHAT HAPPENED? WHAT IS BEING DONE?

Bacteria have entered the water system from an unknown source. We are working with the Fraser Health Authority to investigate/resolve this issue. We have disinfected and flushed the water system with chlorinated water, and will be monitoring continuing test results over the next few weeks.

We will inform you when the problem has been corrected and tests show no bacteria and you no longer need to boil your water. We apologize for the inconvenience.

This notice is posted by the Park Operator:

Alouette Park Management Ltd. (604) 466-8325 Info@alouetteparks.ca

DO NOT DRINK THE WATER (FLUSH ONLY)

Date Issued::
An Unknown Contaminant may have been into the South Beach water supply.
What should I do?
 Do not use the water for DRINKING, COOKING, BRUSHING TEETH, WASHING READY TO EAT FOODS & WASHING DISHES OR BATHING. Water can only be used for FLUSHING TOILETS at this time.
What happened? What is being done?
How long will this Flush Only last?
We are working with the Fraser Health Authority to investigate/resolve this issue We are currently:
We will inform you when the problem has been corrected and that the flush only notice is no longer in effect.
This notice is posted by Alouette Park Management Ltd., the Park Operator for Golden Ears Provincial Park.
Date Distributed:

Arsenic in Drinking Water

Arsenic is found naturally in the rocks in the earth's crust. It can be found in some drinking water supplies, and wells. Drinking water containing arsenic can have serious short-term and long-term health effects.

How does arsenic get into drinking water?

Arsenic can get into drinking water from natural deposits or runoff from agriculture, mining and industrial processes.

In B.C., natural minerals are the most common sources of arsenic in drinking water.

The amount of arsenic in ground water supplies like wells is usually higher than in surface water supplies such as lakes, streams and rivers.

What are the health effects of arsenic exposure?

Short to medium term (days to weeks) exposure to very high levels of arsenic in drinking water can lead to arsenic poisoning.

Symptoms of exposure to high levels of arsenic include stomach pain, vomiting, diarrhea, and impaired nerve function, which may result in 'pins and needles' sensation or numbness and burning in hands and feet.

Arsenic can also cause skin changes, which include darkening, and wart-like or corn-like growths. These are mostly found on the palms of the hands or bottoms of the feet. Other symptoms can include skin flushing and rashes.

As children tend to drink more water per unit of body weight than adults, they may have more exposure to arsenic in drinking water. As a result children may be at greater risk of illness when higher levels of arsenic are present. Long-term (years to decades) exposure to even relatively low amounts of arsenic in drinking water can increase your risk of developing certain cancers, including:

- skin,
- · lung,
- · kidney,
- bladder, and
- liver.

The risk of cancer is the reason for developing the Canadian guideline for arsenic in drinking water. For more information on The Guidelines for Canadian Drinking Water Quality see, https://www.canada.ca/en/health-canada/services/publications/healthy-living/guidelines-canadian-drinking-water-quality-guideline-technical-document-arsenic.html.

What amount of arsenic causes health effects?

Health Canada set a Maximum Acceptable Concentration (MAC) of 10 micrograms per litre for arsenic in drinking water. This can also be reported as 10 μ g/L, or as 0.010 milligrams per litre (mg/L).

This level was set based on the ability to treat water practicably to this level. This amount is still linked with a health risk higher than the level considered to be a very minor risk. For this reason people should consider taking precautions with their drinking water even if the arsenic levels are slightly below the guideline. Data collected in Canada indicates that the levels of arsenic in drinking water is usually less than 0.005 mg\L, but concentrations may be higher in some areas.

How do I know if there is arsenic in my drinking water?

Public drinking water systems are monitored regularly. In drinking water, arsenic has no odor or taste and can only be detected by a chemical test.

Most private wells are not tested routinely for water quality or contaminants. It is the well owner's responsibility to test the water for arsenic. Any well may contain arsenic or other contaminants. Private wells should be tested regularly for water quality.

Contact your local public health unit or environmental health officer for information on the testing process in British Columbia.

For more information about private well water testing, see <u>HealthLinkBC File #05b Should I Get</u> My Well Water Tested?

What can I do if there is arsenic in my drinking water?

Water with arsenic is only a concern if it is being used for drinking or preparing food.

Exposure through breathing and skin contact is not harmful. For example, there are no known health effects from hand washing, bathing or washing clothing in water with arsenic.

If an initial test detects arsenic, even at levels below the guideline, it is important to have a second test done to confirm the results. If your water tests positive for arsenic above the recommended level, you should use another source for drinking water or treat the current source.

There are several treatment devices and options including reverse osmosis filters and distillation. Chlorination and mechanical filters do not remove arsenic from water. Boiling water may increase the concentration of arsenic.

There is no regulatory control over treatment devices for private homes, therefore the well owner must be careful and select an appropriate treatment device that has been certified for the removal of arsenic.

When purchasing a treatment device, you should consider one that has been certified by an organization accredited by the Standards Council of Canada (SCC). The treatment device should meet the following standards:

- NSF/ANSI Standard 62 on drinking water distillation and adsorption systems; or
- Standard 58 on reverse osmosis drinking water treatment systems; or
- Standards 53 on drinking water treatment units
 with specific designation for the water quality parameters you are trying to remove (arsenic).

Certification assures that a device works as the manufacturer or distributor claims. Find an up-to-date list of accredited organizations by visiting Standards Council of Canada at www.scc.ca/en/accreditation/product-process-and-service-certification/directory-of-accredited-clients.

For more information on drinking water and treatment options, contact your local environmental health officer.

Preventing Water-Borne Infections For People with Weakened Immune Systems

Who is at higher risk from water-borne infections?

People with very weak immune systems who are at higher risk of certain water-borne diseases include those with:

- HIV infection who have a CD4+ count of less than 100 cells/mm³;
- lymphoma or leukemia (hematological malignancies) who are being actively treated or have been in remission and off treatment for less than 1 year;
- hematopoietic stem cell transplant recipients; and
- people born with diseases that severely affect their immune systems.

Some people with weakened immune systems, such as those with certain types of cancers or taking certain medications, may not be at higher risk of severe water-borne diseases. These people do not need to take extra precautions with their drinking water.

Ask your doctor or nurse practioner how weak your immune system is, and whether you need to take extra precautions.

How can drinking water become contaminated?

Drinking water can contain different organisms, including bacteria, viruses and parasites, which can cause disease. These organisms can exist in the source water, such as lake water, and survive through treatment, or they can enter the water supply in the distribution system.

Well water can be contaminated if the well is located or constructed in a way that the groundwater it draws from is at risk of containing pathogens (germs) such as a shallow well or a well drilled in fractured rock.

Surface water, such as rivers, lakes and streams, can also contain disease-causing organisms from animal feces.

If you have a weak immune system, you should not drink water from surface sources or groundwater at risk of containing pathogens, unless the water has been treated to remove or inactivate at least 99.9 per cent of parasites (protozoa), 99.99 per cent of viruses and all harmful bacteria.

Most community water systems in B.C. have effective treatment, such as disinfection or chlorination, against bacteria and viruses. However, in many cases, treatment may not provide a 99.9 per cent reduction in infectious parasites. Some water systems and many private supplies have no treatment at all. If the water you drink has not been disinfected, please refer to HealthLinkBC File #49b Disinfecting Drinking Water.

How can I further treat disinfected water?

People with very weak immune systems should consult with their doctor or nurse practitioner and may need to take extra precautions with their drinking water.

Boiling: If your water supply has already been disinfected, bring the water to a full boil to inactivate any *Cryptosporidium* parasites - a major concern for people with weakened

immune systems. For more information, see <u>HealthLinkBC File #48 Cryptosporidium</u> Infection.

If the water has not already been disinfected, bring the water to a full boil for at least 1 minute. This will kill or inactivate bacteria, viruses and parasites. At elevations over 2,000 meters (6,500 feet), boil water for at least 2 minutes to disinfect it.

Do not drink or use tap water to brush your teeth, rinse your mouth, mix drinks or make ice cubes without boiling it first.

Please note that boiling water will get rid of viruses, bacteria and parasites but not chemicals which may be found in the water.

Reverse Osmosis (RO): RO is effective against all disease-causing organisms and many chemical contaminants. Unless it has a high capacity, it will only produce small amounts of water and waste a large volume. Speak to a water treatment specialist to see if this is the best option for you.

Ultraviolet (UV) Treatment: UV light will kill many disease-causing organisms, and is effective against almost all parasites. UV will not kill some bacterial spores and some viruses, so it should not be used unless the water supply is at least disinfected. UV treatment units should meet NSF Standard #55A.

Filters: Filters do not remove bacteria and viruses and should not be used unless the water supply is disinfected first.

If you plan to install a drinking water filter in your home, you will need a system labeled as Absolute 1 micron or smaller, and labeled as meeting ANSI/NSF International Standard #53 for removal of parasites.

Jug-type filters, such as a Brita[®], which sit in a jug and allow water to trickle through, and some tap-mounted and built-in devices are not an appropriate solution. The jug filter models are not effective in removing many disease-causing organisms.

Can I drink bottled water?

Bottled water in B.C. may or may not have been treated. If you have a very weak immune system, check with the bottling company to find out what treatment, if any, it has had. Bottled water that has been properly treated using one of the methods listed above can be used for drinking, brushing teeth, making ice cubes and for recipes where water is used but not boiled, such as cold soups.

For More Information

For more information, including the level of treatment in your local water system, contact your drinking water purveyor or supplier, or the local environmental health officer or drinking water officer. To find your health authority's drinking water contact visit www2.gov.bc.ca/gov/content/environment/air-land-water/water/water-quality/drinking-water-quality/health-authority-contacts.

For more information about water-borne infections and how to safely disinfect your drinking water, see the following HealthLinkBC Files:

- HealthLinkBC File #49a Water-borne Infections in British Columbia
- HealthLinkBC File #49b Disinfecting Drinking Water
- HealthLinkBC File #69b Feeding Your Baby Formula: Safely Making and Storing Formula

Metals in Drinking Water – a message from Fraser Health

Anytime the water in a particular faucet has not been used for six hours or longer, "flush" your cold-water pipes by running the water until you notice a change in temperature. (This could take as little as five to thirty seconds if there has been recent heavy water use such as showering or toilet flushing. Otherwise, it could take two minutes or longer.) The more time water has been sitting in your home's pipes, the more lead it may contain.

Use only water from the cold-tap for drinking, cooking, and especially making baby formula. Hot water is likely to contain higher levels of lead.

The two actions recommended above are very important to the health of your family. They will probably be effective in reducing lead levels because most of the lead in household water usually comes from the plumbing in your house, not from the local water supply.

Conserving water is still important. Rather than just running the water down the drain you could use the water for things such as watering your plants.
