## Reference Information

## Qualifiers for Individual Samples Listed:

Sample Number	Client Sample ID	Qualifier	Description
L2306476-14	SHC1	WSMT	Water sample(s) for total mercury analysis was not submitted in glass or PTFE container with HCl preservative. Results may be biased low.

## QC Samples with Qualifiers &amp; Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Cyanide, Total	B	L2306476-10, -11, -12, -13, -14, -15, -16
Method Blank	Cyanide, Weak Acid Diss	B	L2306476-10, -11, -12, -13, -14, -15, -16
Method Blank	Cyanide, Weak Acid Diss	B	L2306476-10, -9
Method Blank	Ammonia, Total (as N)	B	L2306476-21
Laboratory Control Sample	Cyanide, Weak Acid Diss	LCS-H	L2306476-11, -12, -13, -14, -15, -16
Laboratory Control Sample	Sulfur (S)-Total	MES	L2306476-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2306476-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -21, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2306476-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -21, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2306476-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -21, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2306476-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -21, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Aluminum (Al)-Total	MS-B	L2306476-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Aluminum (Al)-Total	MS-B	L2306476-20, -21
Matrix Spike	Arsenic (As)-Total	MS-B	L2306476-21
Matrix Spike	Barium (Ba)-Total	MS-B	L2306476-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Total	MS-B	L2306476-21
Matrix Spike	Calcium (Ca)-Total	MS-B	L2306476-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Total	MS-B	L2306476-21
Matrix Spike	Calcium (Ca)-Total	MS-B	L2306476-20, -21
Matrix Spike	Iron (Fe)-Total	MS-B	L2306476-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2306476-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2306476-21
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2306476-20, -21
Matrix Spike	Manganese (Mn)-Total	MS-B	L2306476-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Manganese (Mn)-Total	MS-B	L2306476-21
Matrix Spike	Manganese (Mn)-Total	MS-B	L2306476-20, -21
Matrix Spike	Potassium (K)-Total	MS-B	L2306476-21
Matrix Spike	Potassium (K)-Total	MS-B	L2306476-20, -21
Matrix Spike	Sodium (Na)-Total	MS-B	L2306476-21
Matrix Spike	Sodium (Na)-Total	MS-B	L2306476-20, -21
Matrix Spike	Strontium (Sr)-Total	MS-B	L2306476-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Total	MS-B	L2306476-21
Matrix Spike	Strontium (Sr)-Total	MS-B	L2306476-20, -21
Matrix Spike	Titanium (Ti)-Total	MS-B	L2306476-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Nitrate (as N)	MS-B	L2306476-12, -13
Matrix Spike	Phosphorus (P)-Total	MS-B	L2306476-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Orthophosphate-Dissolved (as P)	MS-B	L2306476-1, -10, -2, -3, -4, -5, -6, -7, -8, -9

## Qualifiers for Individual Parameters Listed:

Qualifier	Description
-----------	-------------

## Reference Information

B	Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTSE	Dissolved Se concentration exceeds total. Positive bias on D-Se suspected due to signal enhancement from volatile selenium species. Contact ALS if an alternative test to address this interference is needed.
HTD	Hold time exceeded for re-analysis or dilution, but initial testing was conducted within hold time.
LCS-H	Lab Control Sample recovery was above ALS DQO. Non-detected sample results are considered reliable. Other results, if reported, have been qualified.
MES	Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RRV	Reported Result Verified By Repeat Analysis

### Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
<b>ACY-PCT-VA</b>	Water	Acidity by Automatic Titration	APHA 2310 Acidity
This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.			
Samples of industrial wastes, acid mine drainage, or other solutions that contain appreciable amounts of hydrolyzable metal ions such as aluminum, iron, and manganese may require hot peroxide treatment to ensure oxidation and hydrolysis of reduced forms of polyvalent cations. Acidity results may be highly variable if this procedure is not followed. Results in this report for 'Acidity (as CaCO3)' have not been peroxide treated.			
<b>ALK-TITR-VA</b>	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
<b>BR-L-IC-N-VA</b>	Water	Bromide in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
<b>CARBONS-DOC-VA</b>	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
<b>CARBONS-TOC-VA</b>	Water	Total organic carbon by combustion	APHA 5310B TOTAL ORGANIC CARBON (TOC)
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".			
<b>CL-IC-N-VA</b>	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
<b>CN-FREE-CFA-VA</b>	Water	Free Cyanide in water by CFA	ASTM 7237
This analysis is carried out using procedures adapted from ASTM Method 7237 "Free Cyanide with Flow Injection Analysis (FIA) Utilizing Gas Diffusion Separation and Amperometric Detection". Free cyanide is determined by in-line gas diffusion at pH 6 with final determination by colourimetric analysis.			
<b>CN-T-CFA-VA</b>	Water	Total Cyanide in water by CFA	ISO 14403:2002
This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.			
<b>CN-WAD-CFA-VA</b>	Water	Weak Acid Diss. Cyanide in water by CFA	APHA 4500-CN CYANIDE
This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.			
<b>COLOUR-TRUE-VA</b>	Water	Colour (True) by Spectrometer	BCMOE Colour Single Wavelength
This analysis is carried out using procedures adapted from British Columbia Environmental Manual "Colour- Single Wavelength." Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method. Colour measurements can be highly pH dependent, and apply to the pH of the sample as received (at time of testing), without pH adjustment. Concurrent measurement of sample pH is recommended.			
<b>EC-PCT-VA</b>	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
<b>EC-SCREEN-VA</b>	Water	Conductivity Screen (Internal Use Only)	APHA 2510

## Reference Information

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

**F-IC-N-VA** Water Fluoride in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

**HARDNESS-CALC-VA** Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO<sub>3</sub> equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

**HG-D-CVAA-VA** Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

**HG-T-CVAA-VA** Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

**MET-D-CCMS-VA** Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

**MET-T-CCMS-VA** Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

**N-T-COL-VA** Water Total Nitrogen in water by Colour APHA4500-P(J)/NEMI9171/USGS03-4174

This analysis is carried out using procedures adapted from APHA Method 4500-P (J) "Persulphate Method for Simultaneous Determination of Total Nitrogen and Total Phosphorus" and National Environmental Methods Index - Nemi method 5735.

**NH3-F-VA** Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

**NO2-L-IC-N-VA** Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

**NO3-L-IC-N-VA** Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

**P-T-PRES-COL-VA** Water Total P in Water by Colour APHA 4500-P Phosphorus

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is determined colourimetrically after persulphate digestion of the sample.

Samples with very high dissolved solids (i.e. seawaters, brackish waters) may produce a negative bias by this method. Alternate methods are available for these types of samples.

Arsenic (5+), at elevated levels, is a positive interference on colourimetric phosphate analysis.

**PH-PCT-VA** Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

**PO4-DO-COL-VA** Water Diss. Orthophosphate in Water by Colour APHA 4500-P Phosphorus

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.

Samples with very high dissolved solids (i.e. seawaters, brackish waters) may produce a negative bias by this method. Alternate methods are available for these types of samples.

Arsenic (5+), at elevated levels, is a positive interference on colourimetric phosphate analysis.

**SO4-IC-N-VA** Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

**TDS-VA** Water Total Dissolved Solids by Gravimetric APHA 2540 C - GRAVIMETRIC

## Reference Information

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

**TKN-F-VA** Water TKN in Water by Fluorescence APHA 4500-NORG D.

This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.

**TSS-VA** Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

**TURBIDITY-VA** Water Turbidity by Meter APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

### Chain of Custody Numbers:

17-756320 17-756321

### GLOSSARY OF REPORT TERMS

*Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.*

*mg/kg - milligrams per kilogram based on dry weight of sample.*

*mg/kg wwt - milligrams per kilogram based on wet weight of sample.*

*mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.*

*mg/L - milligrams per litre.*

*< - Less than.*

*D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).*

*N/A - Result not available. Refer to qualifier code and definition for explanation.*

*Test results reported relate only to the samples as received by the laboratory.*

**UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.**

*Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.*

## Reference Information

### QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Laboratory Control Sample	Benz(a)anthracene	LCS-ND	L2335590-1
Matrix Spike	Total Inorganic Carbon	MS-B	L2335590-1
Matrix Spike	Barium (Ba)-Total	MS-B	L2335590-1
Matrix Spike	Calcium (Ca)-Total	MS-B	L2335590-1
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2335590-1
Matrix Spike	Manganese (Mn)-Total	MS-B	L2335590-1
Matrix Spike	Sodium (Na)-Total	MS-B	L2335590-1
Matrix Spike	Strontium (Sr)-Total	MS-B	L2335590-1

### Qualifiers for Individual Parameters Listed:

Qualifier	Description
HTC	Hardness was calculated from Total Ca and/or Mg concentrations and may be biased high (dissolved Ca/Mg results unavailable).
LCS-ND	Lab Control Sample recovery was slightly outside ALS DQO. Reported non-detect results for associated samples were unaffected.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

### Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
<b>ACY-H2O2-MAN-VA</b>	Water	Acidity by Hot Peroxide Titration	APHA - ACIDITY (2310)
This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". The procedure involves preliminary sample treatment by the hot peroxide procedure, and Acidity is subsequently determined by potentiometric titration to a specified endpoint (i.e. pH = 8.3).			
<b>ALK-TITR-VA</b>	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
<b>BR-L-IC-N-VA</b>	Water	Bromide in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
<b>CARBONS-TIC-VA</b>	Water	Total inorganic carbon by CO2 purge	APHA 5310B TOTAL ORGANIC CARBON (TOC)
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".			
<b>CARBONS-TOC-VA</b>	Water	Total organic carbon by combustion	APHA 5310B TOTAL ORGANIC CARBON (TOC)
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".			
<b>CL-IC-N-VA</b>	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
<b>CN-CNO-WT</b>	Water	Cyanate	APHA 4500-CN-L
This analysis is carried out using procedures adapted from APHA method 4500-CN "Cyanide". Cyanate is determined by the Cyanate hydrolysis method using an ammonia selective electrode			
<b>CN-FREE-CFA-VA</b>	Water	Free Cyanide in water by CFA	ASTM 7237
This analysis is carried out using procedures adapted from ASTM Method 7237 "Free Cyanide with Flow Injection Analysis (FIA) Utilizing Gas Diffusion Separation and Amperometric Detection". Free cyanide is determined by in-line gas diffusion at pH 6 with final determination by colourimetric analysis.			
<b>CN-SCN-VA</b>	Water	Thiocyanate by Colour	APHA 4500-CN CYANIDE
This analysis is carried out using procedures adapted from APHA Method 4500-CN- M "Thiocyanate" Thiocyanate is determined by the ferric nitrate colourimetric method. Water samples containing high levels of hexavalent chromium, cyanide (together with sulfide), reducing agents, or hydrocarbons may cause negative or positive interferences with this method. Contact ALS for additional information if required.			
<b>CN-T-CFA-VA</b>	Water	Total Cyanide in water by CFA	ISO 14403:2002
This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.			
<b>CN-WAD-CFA-VA</b>	Water	Weak Acid Diss. Cyanide in water by CFA	APHA 4500-CN CYANIDE
This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.			
<b>COD-COL-VA</b>	Water	Chemical Oxygen Demand by Colorimetric	APHA 5220 D. CHEMICAL OXYGEN DEMAND

## Reference Information

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

**EC-PCT-VA** Water Conductivity (Automated) APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

**EC-SCREEN-VA** Water Conductivity Screen (Internal Use Only) APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

**EPH-ME-FID-VA** Water EPH in Water BC Lab Manual

EPH is extracted from water using a hexane micro-extraction technique, with analysis by GC-FID, as per the BC Lab Manual. EPH results include PAHs and are therefore not equivalent to LEPH or HEPH.

**F-IC-N-VA** Water Fluoride in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

**F1-BTX-CALC-VA** Water F1-Total BTX CCME CWS PHC TIER 1 (2001)

This analysis is based on the "Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil - Tier 1 Method, Canadian Council of Ministers of the Environment, December 2000." For F1 (C6-C10), the sample undergoes a purge and trap extraction prior to analysis by GC/FID. The F1-BTEX result is calculated as follows:

F1-BTEX: F1 (C6-C10) minus benzene, toluene, ethyl benzene and xylenes (BTEX).

**F1-HSFID-VA** Water CCME F1 By Headspace with GCFID EPA 5021A/CCME CWS PHC (Pub# 1310)

This analysis is based on the "Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil - Tier 1 Method, Canadian Council of Ministers of the Environment, December 2000." For F1 (C6-C10), the sample undergoes a headspace purge prior to analysis by GC/FID.

F1 (C6-C10): Sum of all hydrocarbons that elute between nC6 and nC10.

**F2-F4-ME-FID-VA** Water CCME F2-F4 Hydrocarbons in Water CCME CWS-PHC, Pub #1310, Dec 2001

F2-F4 is extracted from water using a hexane micro-extraction technique. Instrumental analysis is by GC-FID, as per the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Tier 1 Method, CCME, Dec 2001.

**HARDNESS-CALC-VA** Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO<sub>3</sub> equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

**HG-T-CVAA-VA** Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

**LEPH/HEPH-CALC-VA** Water LEPHs and HEPHs BC MOE LEPH/HEPH

LEPHw and HEPHw are measures of Light and Heavy Extractable Petroleum Hydrocarbons in water. Results are calculated by subtraction of applicable PAH concentrations from EPH10-19 and EPH19-32, as per the BC Lab Manual LEPH/HEPH calculation procedure.

LEPHw = EPH10-19 minus Acenaphthene, Acridine, Anthracene, Fluorene, Naphthalene and Phenanthrene.

HEPHw = EPH19-32 minus Benz(a)anthracene, Benzo(a)pyrene, Fluoranthene, and Pyrene.

**MET-T-CCMS-VA** Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

**NH3-F-VA** Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

**NO2-L-IC-N-VA** Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

**NO3-L-IC-N-VA** Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

**PAH-ME-MS-VA** Water PAHs in Water EPA 3511/8270D (mod)

PAHs are extracted from water using a hexane micro-extraction technique, with analysis by GC/MS. Because the two isomers cannot be readily separated chromatographically, benzo(j)fluoranthene is reported as part of the benzo(b)fluoranthene parameter.

## Reference Information

<b>PH-PCT-VA</b>	Water	pH by Meter (Automated)	APHA 4500-H pH Value
This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode			
It is recommended that this analysis be conducted in the field.			
<b>SO4-IC-N-VA</b>	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
<b>TDS-VA</b>	Water	Total Dissolved Solids by Gravimetric	APHA 2540 C - GRAVIMETRIC
This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.			
<b>TURBIDITY-VA</b>	Water	Turbidity by Meter	APHA 2130 Turbidity
This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.			
<b>VH-HSFID-VA</b>	Water	VH in Water by Headspace GCFID	BC Env. Lab Manual (VH in Water)
The water sample, with added reagents, is heated in a sealed vial to equilibrium. The headspace from the vial is transferred into a gas chromatograph. Compounds eluting between n-hexane and n-decane are measured and summed together using flame-ionization detection.			
<b>VH-SURR-FID-VA</b>	Water	VH Surrogates for Waters	BC Env. Lab Manual (VH in Solids)
<b>VOC-HSMS-VA</b>	Water	VOCs in water by Headspace GCMS	EPA 5021A/8260C
The water sample, with added reagents, is heated in a sealed vial to equilibrium. The headspace from the vial is transferred into a gas chromatograph. Target compound concentrations are measured using mass spectrometry detection.			
<b>VOC7-HSMS-VA</b>	Water	BTEX/MTBE/Styrene by Headspace GCMS	EPA 5021A/8260C
The water sample, with added reagents, is heated in a sealed vial to equilibrium. The headspace from the vial is transferred into a gas chromatograph. Target compound concentrations are measured using mass spectrometry detection.			
<b>VOC7/VOC-SURR-MS-VA</b>	Water	VOC7 and/or VOC Surrogates for Waters	EPA 5035A/5021A/8260C
<b>VPH-CALC-VA</b>	Water	VPH is VH minus select aromatics	BC MOE VPH
VPHw measures Volatile Petroleum Hydrocarbons in water. Results are calculated by subtraction of specific Monocyclic Aromatic Hydrocarbons from VH6-10, as per the BC Lab Manual VPH calculation procedure. VPHw = VH6-10 minus Benzene, Toluene, Ethylbenzene, Xylenes, and Styrene			
<b>XYLENES-CALC-VA</b>	Water	Sum of Xylene Isomer Concentrations	CALCULATION
Calculation of Total Xylenes			
Total Xylenes is the sum of the concentrations of the ortho, meta, and para Xylene isomers. Results below detection limit (DL) are treated as zero. The DL for Total Xylenes is set to a value no less than the square root of the sum of the squares of the DLs of the individual Xylenes.			

\*\* ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

### Chain of Custody Numbers:

#### GLOSSARY OF REPORT TERMS

*Surrogate* - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

*mg/kg* - milligrams per kilogram based on dry weight of sample.

*mg/kg wwt* - milligrams per kilogram based on wet weight of sample.

*mg/kg lwt* - milligrams per kilogram based on lipid-adjusted weight of sample.

*mg/L* - milligrams per litre.

< - Less than.

*D.L.* - The reported Detection Limit, also known as the Limit of Reporting (LOR).

*N/A* - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

# BC EPH HYDROCARBON DISTRIBUTION REPORT

ALS Sample ID: L2335590-1  
 Client Sample ID: JM10-2018

← EPH10-19 →		← EPH19-32 →	
nC10	nC19	nC29	nC32
174°C	330°C	467°C	
346°F	626°F	873°F	
← Gasoline →		← Diesel/ Jet Fuels →	
		← Motor Oils/ Lube Oils/ Grease →	

The BC EPH Hydrocarbon Distribution Report (HDR) is intended to assist you in characterizing hydrocarbon products that may be present in your sample.

The scale at the bottom of the chromatogram indicates the approximate retention times of common petroleum products and three n-alkane hydrocarbon marker compounds. Retention times may vary between samples, but general patterns and distributions will remain similar.

Peak heights in this report are a function of the sample concentration, the sample amount extracted, the sample dilution factor, and the scale at left.

A "-L-" in the sample ID denotes a low level sample. A "-S-" denotes a silica gel cleaned sample.

Note: This chromatogram was produced using GC conditions that are specific to the ALS Canada EPH method. Refer to the ALS Canada EPH Hydrocarbon Library for a collection of chromatograms from common reference samples (fuels, oils, etc.). The HDR library can be found at [www.alsglobal.com](http://www.alsglobal.com).

# CCME F2-F4 HYDROCARBON DISTRIBUTION REPORT

ALS Sample ID: L2335590-C-1  
 Client Sample ID: JM10-2018

← F2 →		← F3 →		← F4 →	
nC10	nC16		nC34	nC50	
174°C	287°C		481°C	575°C	
346°F	549°F		898°F	1067°F	
← Gasoline →		← Motor Oils/ Lube Oils/ Grease →			
← Diesel/ Jet Fuels →					

The CCME F2-F4 Hydrocarbon Distribution Report (HDR) is intended to assist you in characterizing hydrocarbon products that may be present in your sample.

The scale at the bottom of the chromatogram indicates the approximate retention times of common petroleum products and four n-alkane hydrocarbon marker compounds. Retention times may vary between samples, but general patterns and distributions will remain similar.

Peak heights in this report are a function of the sample concentration, the sample amount extracted, the sample dilution factor, and the scale at left.

Note: This chromatogram was produced using GC conditions that are specific to ALS Canada CCME F2-F4 method. Refer to the ALS Canada CCME F2-F4 Hydrocarbon Library for a collection of chromatograms from common reference samples (fuels, oils, etc.). The HDR library can be found at [www.alsglobal.com](http://www.alsglobal.com).

Matrix Spike	Ammonia, Total (as N)	MS-B	L2335592-22, -23, -24, -25
Matrix Spike	Orthophosphate-Dissolved (as P)	MS-B	L2335592-18, -19
Matrix Spike	Sulfate (SO4)	MS-B	L2335592-10, -11, -12, -13, -14, -15, -16, -17

## Qualifiers for Individual Parameters Listed:

Qualifier	Description
-----------	-------------

Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered

## Reference Information

B	reliable.
CNP	Cyanide test sample appears to have been preserved, but pH was <10 at time of testing. Results may be biased low, particularly for Free CN species.
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
HTP	Sample preparation or preservation hold time was exceeded.
LCS-H	Lab Control Sample recovery was above ALS DQO. Non-detected sample results are considered reliable. Other results, if reported, have been qualified.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RRR	Refer to Report Remarks for issues regarding this analysis
RRV	Reported Result Verified By Repeat Analysis

### Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
<b>ACY-PCT-VA</b>	Water	Acidity by Automatic Titration	APHA 2310 Acidity
This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.			
Samples of industrial wastes, acid mine drainage, or other solutions that contain appreciable amounts of hydrolyzable metal ions such as aluminum, iron, and manganese may require hot peroxide treatment to ensure oxidation and hydrolysis of reduced forms of polyvalent cations. Acidity results may be highly variable if this procedure is not followed. Results in this report for 'Acidity (as CaCO3)' have not been peroxide treated.			
<b>ALK-TITR-VA</b>	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
<b>BR-L-IC-N-VA</b>	Water	Bromide in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
<b>CARBONS-DOC-VA</b>	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
<b>CARBONS-TOC-VA</b>	Water	Total organic carbon by combustion	APHA 5310B TOTAL ORGANIC CARBON (TOC)
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".			
<b>CL-IC-N-VA</b>	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
<b>CN-T-CFA-VA</b>	Water	Total Cyanide in water by CFA	ISO 14403:2002
This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.			
<b>CN-WAD-CFA-VA</b>	Water	Weak Acid Diss. Cyanide in water by CFA	APHA 4500-CN CYANIDE
This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.			
<b>COLOUR-TRUE-VA</b>	Water	Colour (True) by Spectrometer	BCMOE Colour Single Wavelength
This analysis is carried out using procedures adapted from British Columbia Environmental Manual "Colour- Single Wavelength." Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method.			
Colour measurements can be highly pH dependent, and apply to the pH of the sample as received (at time of testing), without pH adjustment. Concurrent measurement of sample pH is recommended.			
<b>EC-PCT-VA</b>	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
<b>EC-SCREEN-VA</b>	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
<b>F-IC-N-VA</b>	Water	Fluoride in Water by IC	EPA 300.1 (mod)

## Reference Information

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

**HARDNESS-CALC-VA** Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO<sub>3</sub> equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

**HG-D-CVAA-VA** Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

**HG-T-CVAA-VA** Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

**MET-D-CCMS-VA** Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

**MET-T-CCMS-VA** Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

**N-T-COL-VA** Water Total Nitrogen in water by Colour APHA4500-P(J)/NEMI9171/USGS03-4174

This analysis is carried out using procedures adapted from APHA Method 4500-P (J) "Persulphate Method for Simultaneous Determination of Total Nitrogen and Total Phosphorus" and National Environmental Methods Index - Nemi method 5735.

**NH3-F-VA** Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

**NO2-L-IC-N-VA** Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

**NO3-L-IC-N-VA** Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

**P-T-PRES-COL-VA** Water Total P in Water by Colour APHA 4500-P Phosphorus

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is determined colourimetrically after persulphate digestion of the sample.

Samples with very high dissolved solids (i.e. seawaters, brackish waters) may produce a negative bias by this method. Alternate methods are available for these types of samples.

Arsenic (5+), at elevated levels, is a positive interference on colourimetric phosphate analysis.

**PH-PCT-VA** Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

**PO4-DO-COL-VA** Water Diss. Orthophosphate in Water by Colour APHA 4500-P Phosphorus

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.

Samples with very high dissolved solids (i.e. seawaters, brackish waters) may produce a negative bias by this method. Alternate methods are available for these types of samples.

Arsenic (5+), at elevated levels, is a positive interference on colourimetric phosphate analysis.

**SO4-IC-N-VA** Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

**TDS-VA** Water Total Dissolved Solids by Gravimetric APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

**TKN-F-VA** Water TKN in Water by Fluorescence APHA 4500-NORG D.

## Reference Information

This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.

**TSS-VA**                      Water              Total Suspended Solids by Gravimetric                      APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

**TURBIDITY-VA**                      Water              Turbidity by Meter                      APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

---

\*\* ALS test methods may incorporate modifications from specified reference methods to improve performance.

---

*The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:*

### Chain of Custody Numbers:

#### GLOSSARY OF REPORT TERMS

*Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.*

*mg/kg - milligrams per kilogram based on dry weight of sample.*

*mg/kg wwt - milligrams per kilogram based on wet weight of sample.*

*mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.*

*mg/L - milligrams per litre.*

*< - Less than.*

*D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).*

*N/A - Result not available. Refer to qualifier code and definition for explanation.*

*Test results reported relate only to the samples as received by the laboratory.*

**UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.**

*Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.*

Description	Water	Water	Water	Water	
Sampled Date	29-SEP-19	29-SEP-19	29-SEP-19	29-SEP-19	
Sampled Time	15:30	15:40			
Client ID	JM13	JM3	DUP1	TRAVEL BLANK	
Grouping	Analyte				
<b>WATER</b>					
<b>Dissolved Metals</b>	Chromium (Cr)-Dissolved (mg/L)	<0.00010	<0.00010	<0.00010	
	Cobalt (Co)-Dissolved (mg/L)	0.00058	0.00090	<0.00010	
	Copper (Cu)-Dissolved (mg/L)	0.0244	0.0372	0.00151	
	Iron (Fe)-Dissolved (mg/L)	<0.030	<0.030	<0.030	
	Lead (Pb)-Dissolved (mg/L)	<0.000050	<0.000050	<0.000050	
	Lithium (Li)-Dissolved (mg/L)	0.0011	0.0018	<0.0010	
	Magnesium (Mg)-Dissolved (mg/L)	4.39	7.34	0.979	
	Manganese (Mn)-Dissolved (mg/L)	0.240	0.337	0.00227	
	Mercury (Hg)-Dissolved (mg/L)	<0.0000050	<0.0000050	<0.0000050	
	Molybdenum (Mo)-Dissolved (mg/L)	0.000287	0.000347	<0.000050	
	Nickel (Ni)-Dissolved (mg/L)	<0.00050	<0.00050	<0.00050	
	Phosphorus (P)-Dissolved (mg/L)	<0.30	<0.30	<0.30	
	Potassium (K)-Dissolved (mg/L)	1.91	2.08	0.720	
	Selenium (Se)-Dissolved (mg/L)	0.000178	0.000212	0.000050	
	Silicon (Si)-Dissolved (mg/L)	2.01	2.09	0.142	
	Silver (Ag)-Dissolved (mg/L)	<0.000010	<0.000010	<0.000010	
	Sodium (Na)-Dissolved (mg/L)	<2.0	<2.0	<2.0	
	Strontium (Sr)-Dissolved (mg/L)	0.339	0.547	0.0406	
	Sulfur (S)-Dissolved (mg/L)	17.4	25.5	5.70	
	Thallium (Tl)-Dissolved (mg/L)	<0.000010	<0.000010	<0.000010	
	Tin (Sn)-Dissolved (mg/L)	<0.00010	<0.00010	<0.00010	
	Titanium (Ti)-Dissolved (mg/L)	<0.010	<0.010	<0.010	
	Uranium (U)-Dissolved (mg/L)	0.000405	0.000748	<0.000010	
	Vanadium (V)-Dissolved (mg/L)	<0.00050	<0.00050	<0.00050	
	Zinc (Zn)-Dissolved (mg/L)	0.0235	0.0370	0.0022	

\* Please refer to the Reference Information section for an explanation of any qualifiers detected.

## Reference Information

### QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Laboratory Control Sample	Conductivity	LCS-H	L2357754-1, -10, -11, -12, -13, -14, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Dissolved Organic Carbon	MS-B	L2357754-10, -11, -12, -13, -14, -8, -9
Matrix Spike	Total Organic Carbon	MS-B	L2357754-10
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2357754-1, -10, -11, -12, -13, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2357754-1, -10, -11, -12, -13, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2357754-1, -10, -11, -12, -13, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2357754-1, -10, -11, -12, -13, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Total	MS-B	L2357754-1, -10, -11, -12, -13, -14, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Total	MS-B	L2357754-2
Matrix Spike	Calcium (Ca)-Total	MS-B	L2357754-1, -10, -11, -12, -13, -14, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Total	MS-B	L2357754-2
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2357754-1, -10, -11, -12, -13, -14, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2357754-2
Matrix Spike	Manganese (Mn)-Total	MS-B	L2357754-1, -10, -11, -12, -13, -14, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Manganese (Mn)-Total	MS-B	L2357754-2
Matrix Spike	Molybdenum (Mo)-Total	MS-B	L2357754-2
Matrix Spike	Nickel (Ni)-Total	MS-B	L2357754-2
Matrix Spike	Potassium (K)-Total	MS-B	L2357754-2
Matrix Spike	Sodium (Na)-Total	MS-B	L2357754-2
Matrix Spike	Strontium (Sr)-Total	MS-B	L2357754-1, -10, -11, -12, -13, -14, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Total	MS-B	L2357754-2
Matrix Spike	Sulfur (S)-Total	MS-B	L2357754-2
Matrix Spike	Uranium (U)-Total	MS-B	L2357754-2
Matrix Spike	Phosphorus (P)-Total	MS-B	L2357754-10, -11, -12, -8, -9
Matrix Spike	Phosphorus (P)-Total	MS-B	L2357754-1, -2, -3, -4, -5, -6, -7

### Qualifiers for Individual Parameters Listed:

Qualifier	Description
LCS-H	Lab Control Sample recovery was above ALS DQO. Non-detected sample results are considered reliable. Other results, if reported, have been qualified.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

### Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
<b>ACY-PCT-VA</b>	Water	Acidity by Automatic Titration	APHA 2310 Acidity
This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.			
Samples of industrial wastes, acid mine drainage, or other solutions that contain appreciable amounts of hydrolyzable metal ions such as aluminum, iron, and manganese may require hot peroxide treatment to ensure oxidation and hydrolysis of reduced forms of polyvalent cations. Acidity results may be highly variable if this procedure is not followed. Results in this report for 'Acidity (as CaCO3)' have not been peroxide treated.			
<b>ALK-TITR-VA</b>	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
<b>BR-L-IC-N-VA</b>	Water	Bromide in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
<b>CARBONS-DOC-VA</b>	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
<b>CARBONS-TOC-VA</b>	Water	Total organic carbon by combustion	APHA 5310B TOTAL ORGANIC CARBON (TOC)

## Reference Information

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".

**CL-IC-N-VA** Water Chloride in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

**CN-FREE-CFA-WT** Water Free Cyanide in water by CFA ASTM 7237

This analysis is carried out using procedures adapted from ASTM Method 7237 "Free Cyanide with Flow Injection Analysis (FIA) Utilizing Gas Diffusion Separation and Amperometric Detection". Free cyanide is determined by in-line gas diffusion at pH 6 with final determination by colourimetric analysis.

**CN-TOT-WT** Water Cyanide, Total ISO 14403-2

Total cyanide is determined by the combination of UV digestion and distillation. Cyanide is converted to cyanogen chloride by reacting with chloramine-T, the cyanogen chloride then reacts with a combination of barbituric acid and isonicotinic acid to form a highly colored complex.

When using this method, high levels of thiocyanate in samples can cause false positives at ~1-2% of the thiocyanate concentration. For samples with detectable cyanide analyzed by this method, ALS recommends analysis for thiocyanate to check for this potential interference

**CN-WAD-WT** Water Cyanide, Weak Acid Diss APHA 4500CN I-Weak acid Dist Colorimet

Weak acid dissociable cyanide (WAD) is determined by undergoing a distillation procedure. Cyanide is converted to cyanogen chloride by reacting with chloramine-T, the cyanogen chloride then reacts with a combination of barbituric acid and isonicotinic acid to form a highly colored complex.

**COLOUR-TRUE-VA** Water Colour (True) by Spectrometer BCMOE Colour Single Wavelength

This analysis is carried out using procedures adapted from British Columbia Environmental Manual "Colour- Single Wavelength." Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method.

Colour measurements can be highly pH dependent, and apply to the pH of the sample as received (at time of testing), without pH adjustment. Concurrent measurement of sample pH is recommended.

**EC-PCT-VA** Water Conductivity (Automated) APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

**EC-SCREEN-VA** Water Conductivity Screen (Internal Use Only) APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

**F-IC-N-VA** Water Fluoride in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

**HARDNESS-CALC-VA** Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO<sub>3</sub> equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

**HG-D-CVAA-VA** Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

**HG-T-CVAA-VA** Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

**MET-D-CCMS-VA** Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

**MET-T-CCMS-VA** Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

**N-T-COL-VA** Water Total Nitrogen in water by Colour APHA4500-P(J)/NEMI9171/USGS03-4174

This analysis is carried out using procedures adapted from APHA Method 4500-P (J) "Persulphate Method for Simultaneous Determination of Total Nitrogen and Total Phosphorus" and National Environmental Methods Index - Nemi method 5735.

**NH3-F-VA** Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

**NO2-L-IC-N-VA** Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

## Reference Information

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

**NO3-L-IC-N-VA** Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

**P-T-PRES-COL-VA** Water Total P in Water by Colour APHA 4500-P Phosphorus

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is determined colourimetrically after persulphate digestion of the sample.

Samples with very high dissolved solids (i.e. seawaters, brackish waters) may produce a negative bias by this method. Alternate methods are available for these types of samples.

Arsenic (5+), at elevated levels, is a positive interference on colourimetric phosphate analysis.

**PH-PCT-VA** Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

**PO4-DO-COL-VA** Water Diss. Orthophosphate in Water by Colour APHA 4500-P Phosphorus

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.

Samples with very high dissolved solids (i.e. seawaters, brackish waters) may produce a negative bias by this method. Alternate methods are available for these types of samples.

Arsenic (5+), at elevated levels, is a positive interference on colourimetric phosphate analysis.

**SO4-IC-N-VA** Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

**TDS-VA** Water Total Dissolved Solids by Gravimetric APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

**TKN-F-VA** Water TKN in Water by Fluorescence APHA 4500-NORG D.

This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.

**TSS-VA** Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

**TURBIDITY-VA** Water Turbidity by Meter APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

\*\* ALS test methods may incorporate modifications from specified reference methods to improve performance.

*The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:*

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

### Chain of Custody Numbers:

17-763276

## Reference Information

### GLOSSARY OF REPORT TERMS

*Surrogate* - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

*mg/kg* - milligrams per kilogram based on dry weight of sample.

*mg/kg wwt* - milligrams per kilogram based on wet weight of sample.

*mg/kg lwt* - milligrams per kilogram based on lipid-adjusted weight of sample.

*mg/L* - milligrams per litre.

*<* - Less than.

*D.L.* - The reported Detection Limit, also known as the Limit of Reporting (LOR).

*N/A* - Result not available. Refer to qualifier code and definition for explanation.

*Test results reported relate only to the samples as received by the laboratory.*

**UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.**

*Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.*

## Reference Information

### Qualifiers for Individual Samples Listed:

Sample Number	Client Sample ID	Qualifier	Description
L2359242-10	DUP2	WSMD	Water sample(s) for dissolved mercury analysis was not submitted in glass or PTFE container with HCl preservative. Results may be biased low.
L2359242-4	JM2	WSMT	Water sample(s) for total mercury analysis was not submitted in glass or PTFE container with HCl preservative. Results may be biased low.

### QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Laboratory Control Sample	Lithium (Li)-Dissolved	MES	L2359242-1, -10, -11, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Total Organic Carbon	MS-B	L2359242-10, -11, -3, -4, -5, -6, -7, -9
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2359242-1, -10, -11, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2359242-1, -10, -11, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2359242-1, -10, -11, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2359242-1, -10, -11, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2359242-1, -10, -11, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Aluminum (Al)-Total	MS-B	L2359242-1, -10, -11, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Arsenic (As)-Total	MS-B	L2359242-11
Matrix Spike	Barium (Ba)-Total	MS-B	L2359242-11
Matrix Spike	Calcium (Ca)-Total	MS-B	L2359242-11
Matrix Spike	Calcium (Ca)-Total	MS-B	L2359242-11
Matrix Spike	Iron (Fe)-Total	MS-B	L2359242-1, -10, -11, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2359242-1, -10, -11, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2359242-11
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2359242-11
Matrix Spike	Manganese (Mn)-Total	MS-B	L2359242-1, -10, -11, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Total	MS-B	L2359242-11
Matrix Spike	Strontium (Sr)-Total	MS-B	L2359242-11
Matrix Spike	Strontium (Sr)-Total	MS-B	L2359242-11
Matrix Spike	Titanium (Ti)-Total	MS-B	L2359242-1, -10, -11, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Phosphorus (P)-Total	MS-B	L2359242-10, -11, -3, -4, -5, -6, -7, -8, -9

### Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MES	Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RRV	Reported Result Verified By Repeat Analysis
TKNI	TKN result may be biased low due to Nitrate interference. Nitrate-N is > 10x TKN.

### Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
<b>ACY-PCT-VA</b>	Water	Acidity by Automatic Titration	APHA 2310 Acidity
This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.			
Samples of industrial wastes, acid mine drainage, or other solutions that contain appreciable amounts of hydrolyzable metal ions such as aluminum, iron, and manganese may require hot peroxide treatment to ensure oxidation and hydrolysis of reduced forms of polyvalent cations. Acidity results may be highly variable if this procedure is not followed. Results in this report for 'Acidity (as CaCO3)' have not been peroxide treated.			
<b>ALK-TITR-VA</b>	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
<b>BR-L-IC-N-VA</b>	Water	Bromide in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			

## Reference Information

<b>CARBONS-DOC-VA</b>	Water	Dissolved organic carbon by combustion	APHA 5310B
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.			
<b>CARBONS-TOC-VA</b>	Water	Total organic carbon by combustion	APHA 5310B TOTAL ORGANIC CARBON (TOC)
This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".			
<b>CL-IC-N-VA</b>	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
<b>CN-FREE-CFA-VA</b>	Water	Free Cyanide in water by CFA	ASTM 7237
This analysis is carried out using procedures adapted from ASTM Method 7237 "Free Cyanide with Flow Injection Analysis (FIA) Utilizing Gas Diffusion Separation and Amperometric Detection". Free cyanide is determined by in-line gas diffusion at pH 6 with final determination by colourimetric analysis.			
<b>CN-T-CFA-VA</b>	Water	Total Cyanide in water by CFA	ISO 14403:2002
This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.			
<b>CN-WAD-CFA-VA</b>	Water	Weak Acid Diss. Cyanide in water by CFA	APHA 4500-CN CYANIDE
This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.			
<b>COLOUR-TRUE-VA</b>	Water	Colour (True) by Spectrometer	BCMOE Colour Single Wavelength
This analysis is carried out using procedures adapted from British Columbia Environmental Manual "Colour- Single Wavelength." Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method.			
Colour measurements can be highly pH dependent, and apply to the pH of the sample as received (at time of testing), without pH adjustment. Concurrent measurement of sample pH is recommended.			
<b>EC-PCT-VA</b>	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.
This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.			
<b>EC-SCREEN-VA</b>	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
<b>F-IC-N-VA</b>	Water	Fluoride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
<b>HARDNESS-CALC-VA</b>	Water	Hardness	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO <sub>3</sub> equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
<b>HG-D-CVAA-VA</b>	Water	Diss. Mercury in Water by CVAAS or CVAFS	APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
<b>HG-T-CVAA-VA</b>	Water	Total Mercury in Water by CVAAS or CVAFS	EPA 1631E (mod)
Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.			
<b>MET-D-CCMS-VA</b>	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
<b>MET-T-CCMS-VA</b>	Water	Total Metals in Water by CRC ICPMS	EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.			
Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.			
<b>N-T-COL-VA</b>	Water	Total Nitrogen in water by Colour	APHA4500-P(J)/NEMI9171/USGS03-4174
This analysis is carried out using procedures adapted from APHA Method 4500-P (J) "Persulphate Method for Simultaneous Determination of Total Nitrogen and Total Phosphorus" and National Environmental Methods Index - Nemi method 5735.			
<b>NH3-F-VA</b>	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

## Reference Information

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

**NO2-L-IC-N-VA**                      Water              Nitrite in Water by IC (Low Level)                      EPA 300.1 (mod)  
 Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

**NO3-L-IC-N-VA**                      Water              Nitrate in Water by IC (Low Level)                      EPA 300.1 (mod)  
 Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

**P-T-PRES-COL-VA**                      Water              Total P in Water by Colour                      APHA 4500-P Phosphorus  
 This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is determined colourimetrically after persulphate digestion of the sample.  
 Samples with very high dissolved solids (i.e. seawaters, brackish waters) may produce a negative bias by this method. Alternate methods are available for these types of samples.

Arsenic (5+), at elevated levels, is a positive interference on colourimetric phosphate analysis.

**PH-PCT-VA**                      Water              pH by Meter (Automated)                      APHA 4500-H pH Value  
 This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

**PO4-DO-COL-VA**                      Water              Diss. Orthophosphate in Water by Colour                      APHA 4500-P Phosphorus  
 This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.  
 Samples with very high dissolved solids (i.e. seawaters, brackish waters) may produce a negative bias by this method. Alternate methods are available for these types of samples.

Arsenic (5+), at elevated levels, is a positive interference on colourimetric phosphate analysis.

**SO4-IC-N-VA**                      Water              Sulfate in Water by IC                      EPA 300.1 (mod)  
 Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

**TDS-VA**                      Water              Total Dissolved Solids by Gravimetric                      APHA 2540 C - GRAVIMETRIC  
 This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

**TKN-F-VA**                      Water              TKN in Water by Fluorescence                      APHA 4500-NORG D.  
 This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.

**TSS-VA**                      Water              Total Suspended Solids by Gravimetric                      APHA 2540 D - GRAVIMETRIC  
 This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.  
 Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

**TURBIDITY-VA**                      Water              Turbidity by Meter                      APHA 2130 Turbidity  
 This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

## Reference Information

### GLOSSARY OF REPORT TERMS

*Surrogate* - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

*mg/kg* - milligrams per kilogram based on dry weight of sample.

*mg/kg wwt* - milligrams per kilogram based on wet weight of sample.

*mg/kg lwt* - milligrams per kilogram based on lipid-adjusted weight of sample.

*mg/L* - milligrams per litre.

*<* - Less than.

*D.L.* - The reported Detection Limit, also known as the Limit of Reporting (LOR).

*N/A* - Result not available. Refer to qualifier code and definition for explanation.

*Test results reported relate only to the samples as received by the laboratory.*

**UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.**

*Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.*

Shaneel Dayal	Analyst	Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics - Water Quality, Burnaby, British Columbia
Walt Kippenhuck	Team Leader - Inorganics	Inorganics, Waterloo, Ontario

## General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances  
LOR: Limit of Reporting (detection limit).

<i>Unit</i>	<i>Description</i>
-	No Unit
µg/L	micrograms per litre
µS/cm	Microsiemens per centimetre
CU	colour units
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "**Preliminary Report**" are considered authorized for use.

## Workorder Comments

## Qualifiers

<i>Qualifier</i>	<i>Description</i>
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DLQ	Detection Limit raised due to co-eluting interference. GCMS qualifier ion ratio did not meet acceptance criteria.
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
RRV	Reported result verified by repeat analysis.

No. of samples received	: 24		
No. of samples analysed	: 24		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

### Key

**Anonymous:** Refers to samples which are not part of this work order, but which formed part of the QC process lot.

**CAS Number:** Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

**DQO:** Data Quality Objective.

**LOR:** Limit of Reporting (detection limit).

**RPD:** Relative Percent Difference.

## Summary of Outliers

### **Outliers : Quality Control Samples**

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

### **Outliers: Reference Material (RM) Samples**

- No Reference Material (RM) Sample outliers occur.

### **Outliers : Analysis Holding Time Compliance (Breaches)**

- Analysis Holding Time Outliers exist - please see following pages for full details.

### **Outliers : Frequency of Quality Control Samples**

- No Quality Control Sample Frequency Outliers occur.

RIGHT SOLUTIONS | RIGHT PARTNER

## Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

**Legend & Qualifier Definitions**

- EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended
- EHTR: Exceeded ALS recommended hold time prior to sample receipt.
- EHT: Exceeded ALS recommended hold time prior to analysis.
- Rec. HT: ALS recommended hold time (see units).

## Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water** Evaluation: \* = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type	Method	QC Lot #	Count		Frequency (%)		Evaluation
			QC	Regular	Actual	Expected	
<b>Analytical Methods</b>							
<b>Laboratory Duplicates (DUP)</b>							
Acidity by Titration	E283	78794	2	39	5.1	5.0	✓
Acidity by Titration (Peroxide Treated)	E284A	80003	1	1	100.0	5.0	✓
Alkalinity Species by Titration	E290	78792	2	39	5.1	5.0	✓
Ammonia by Fluorescence	E298	78790	2	40	5.0	5.0	✓

## Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4  Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283  Vancouver - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to a specified endpoint.
Acidity by Titration (Peroxide Treated)	E284A  Vancouver - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration with preliminary hot peroxide treatment to a specified endpoint.
Alkalinity Species by Titration	E290  Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298  Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318  Vancouver - Environmental	Water	APHA 4500-Norg D (mod)	Total Kjeldahl Nitrogen is determined using block digestion followed by flow-injection analysis with fluorescence detection.
Colour (True) by Spectrometer	E329  Vancouver - Environmental	Water	APHA 2120 C (mod)	Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method. Colour measurements can be highly pH dependent, and apply to the pH of the sample as received (at time of testing), without pH adjustment.
Total Cyanide by CFA	E333  Vancouver - Environmental	Water	ISO 14403 (mod)	Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.
WAD Cyanide by CFA	E336  Vancouver - Environmental	Water	APHA 4500-CN I (mod)	Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.
Free Cyanide by CFA	E339  Vancouver - Environmental	Water	ASTM D7237 (mod)	Free cyanide is determined by in-line gas diffusion at pH 6 with final determination by colourimetric analysis.
Cyanate by Ion Selective Electrode	E343  Waterloo - Environmental	Water	APHA 4500-CN L (mod)	This analysis is carried out using procedures adapted from APHA method 4500-CN "Cyanide". Cyanate is determined by the Cyanate hydrolysis method using an ammonia selective electrode

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Thiocyanate by Colourimetry	E344  Vancouver - Environmental	Water	APHA 4500-CN M (mod)	Thiocyanate is determined by the ferric nitrate colourimetric method. Water samples containing high levels of hexavalent chromium, cyanide (together with sulfide), reducing agents, or hydrocarbons may cause negative or positive interferences with this method.
Total Inorganic Carbon by Combustion (Low Level)	E354-L  Vancouver - Environmental	Water	APHA 5310 B (mod)	Total Inorganic Carbon is determined by the high temperature combustion method with measurement by an infrared detector, where the sample is acidified in a reaction chamber to convert all inorganic carbons (carbonates) to carbon dioxide for analysis.
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L  Vancouver - Environmental	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO <sub>2</sub> . NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Dissolved Organic Carbon by Combustion (Low Level)	E358-L  Vancouver - Environmental	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO <sub>2</sub> . NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Nitrogen by Colourimetry	E366  Vancouver - Environmental	Water	APHA 4500-P J (mod)	Total Nitrogen is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U  Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level)	E378-U  Vancouver - Environmental	Water	APHA 4500-P E (mod)	Dissolved Orthophosphate is determined colourimetrically on a water sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Metals in Water by CRC ICPMS	E420  Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.  Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L  Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421  Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS.  Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L  Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Total Mercury in Water by CVAAS	E508  Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Dissolved Mercury in Water by CVAAS	E509  Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Chemical Oxygen Demand by Colourimetry	E559  Vancouver - Environmental	Water	APHA 5220 D (mod)	Samples are analyzed using the closed reflux colourimetric method.
VH and F1 by Headspace GC-FID	E581.VH+F1  Vancouver - Environmental	Water	BC MOE Lab Manual / CCME PHC in Soil - Tier 1 (mod)	Volatile Hydrocarbons (VH and F1) is analyzed by static headspace GC-FID. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
BC PHC - EPH by GC-FID	E601A  Vancouver - Environmental	Water	BC MOE Lab Manual	Extractable Petroleum Hydrocarbons (EPH) are analyzed by GC-FID.
BTEX by Headspace GC-MS	E611A  Vancouver - Environmental	Water	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
PAHs by LVI GC-MS	E641A  Vancouver - Environmental	Water	EPA 8270E (mod)	Polycyclic Aromatic Hydrocarbons (PAHs) are analyzed by large volume injection (LVI) GC-MS.
Dissolved Hardness (Calculated)	EC100  Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO <sub>3</sub> ), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO <sub>3</sub> equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Hardness (Calculated) from Total Ca/Mg	EC100A  Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO <sub>3</sub> ), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO <sub>3</sub> equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
VPH: VH-BTEX-Styrene	EC580A  Vancouver - Environmental	Water	BC MOE Lab Manual (VPH in Water and Solids) (mod)	Volatile Petroleum Hydrocarbons (VPH) is calculated as follows: VPHw = Volatile Hydrocarbons (VH6-10) minus benzene, toluene, ethylbenzene, xylenes (BTEX) and styrene.
LEPH and HEPH: EPH-PAH	EC600A  Vancouver - Environmental	Water	BC MOE Lab Manual (LEPH and HEPH) (mod)	Light Extractable Petroleum Hydrocarbons (LEPH) and Heavy Extractable Petroleum Hydrocarbons (HEPH) are calculated as follows: LEPH = Extractable Petroleum Hydrocarbons (EPH10-19) minus Acenaphthene, Acridine, Anthracene, Fluorene, Naphthalene and Phenanthrene; HEPH = Extractable Petroleum Hydrocarbons (EPH19-32) minus Benz(a)anthracene, Benzo(a)pyrene, Fluoranthene, and Pyrene.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Digestion for TKN in water	EP318  Vancouver - Environmental	Water	APHA 4500-Norg D (mod)	Samples are digested using block digestion with Copper Sulfate Digestion Reagent.
Digestion for Total Nitrogen in water	EP366  Vancouver - Environmental	Water	APHA 4500-P J (mod)	Samples are heated with a persulfate digestion reagent.
Digestion for Total Phosphorus in water	EP372  Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421  Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO <sub>3</sub> .
Dissolved Mercury Water Filtration	EP509  Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.
VOCs Preparation for Headspace Analysis	EP581  Vancouver - Environmental	Water	EPA 5021A (mod)	Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler. An aliquot of the headspace is then injected into the GC/MS-FID system.
PHCs and PAHs Hexane Extraction	EP601  Vancouver - Environmental	Water	EPA 3511 (mod)	Petroleum Hydrocarbons (PHCs) and Polycyclic Aromatic Hydrocarbons (PAHs) are extracted using a hexane liquid-liquid extraction.

## QUALITY CONTROL REPORT

**Work Order** : **VA20B3842**

**Page** : 1 of 41

**Client** : ERM Consultants Canada Ltd.  
**Contact** : Jill Zyla  
**Address** : # 400 - 106 Front Street East  
 Toronto ON Canada M5A 1E1

**Date Analysis Commenced** : 28-Aug-2020  
**Issue Date** : 10-Sep-2020 14:18

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

### Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Laboratory Department</i>
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Brianna Allen	Department Manager Organics	Organics, Burnaby, British Columbia
Bruna Botti	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Caitlin Macey	Team Leader Inorganics	Inorganics Water Quality, Burnaby, British Columbia
Clarie Tejano		Metals, Burnaby, British Columbia
Cristina Alexandre	Supervisor Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Ian Cronshaw	Analyst	Metals, Burnaby, British Columbia
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Kim Jensen	Department Manager Metals	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Monica Ko	Lab Assistant	Metals, Burnaby, British Columbia
Omar Beydoun	Lab Assistant	Metals, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia

## **General Comments**

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO = Data Quality Objective.

LOR = Limit of Reporting (detection limit).

RPD = Relative Percentage Difference

# = Indicates a QC result that did not meet the ALS DQO.

### Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: Water					Laboratory Duplicate (DUP) Report

## Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

## Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

### Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

**Reference Material (RM) Report**

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix: **Water**

## General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances  
LOR: Limit of Reporting (detection limit).

<i>Unit</i>	<i>Description</i>
-	No Unit
µg/L	micrograms per litre
µS/cm	Microsiemens per centimetre
CU	colour units
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "**Preliminary Report**" are considered authorized for use.

## Qualifiers

<i>Qualifier</i>	<i>Description</i>
DTMF	Dissolved concentration exceeds total for field-filtered metals sample. Metallic contaminants may have been introduced to dissolved sample during field filtration.
RRV	Reported result verified by repeat analysis.

Quote number	: Q74326		
No. of samples received	: 16		
No. of samples analysed	: 16		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

### Key

- Anonymous:** Refers to samples which are not part of this work order, but which formed part of the QC process lot.  
**CAS Number:** Chemical Abstracts Services number is a unique identifier assigned to discrete substances.  
**DQO:** Data Quality Objective.  
**LOR:** Limit of Reporting (detection limit).  
**RPD:** Relative Percent Difference.

## Summary of Outliers

### **Outliers : Quality Control Samples**

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

### **Outliers: Reference Material (RM) Samples**

- No Reference Material (RM) Sample outliers occur.

### **Outliers : Analysis Holding Time Compliance (Breaches)**

- Analysis Holding Time Outliers exist - please see following pages for full details.

### **Outliers : Frequency of Quality Control Samples**

- No Quality Control Sample Frequency Outliers occur.

RIGHT SOLUTIONS | RIGHT PARTNER

## Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

**Legend & Qualifier Definitions**

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

Rec. HT: ALS recommended hold time (see units).

## Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water** Evaluation: \* = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type	Method	QC Lot #	Count		Frequency (%)		Evaluation
			QC	Regular	Actual	Expected	
<b>Analytical Methods</b>							
<b>Laboratory Duplicates (DUP)</b>							
Acidity by Titration	E283	78556	1	16	6.2	5.0	✓
Alkalinity Species by Titration	E290	78554	1	16	6.2	5.0	✓
Ammonia by Fluorescence	E298	78807	1	20	5.0	5.0	✓
Bromide in Water by IC (Low Level)	E235.Br-L	78559	1	16	6.2	5.0	✓

## Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.S04  Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283  Vancouver - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to a specified endpoint.
Alkalinity Species by Titration	E290  Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298  Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318  Vancouver - Environmental	Water	APHA 4500-Norg D (mod)	Total Kjeldahl Nitrogen is determined using block digestion followed by flow-injection analysis with fluorescence detection.
Colour (True) by Spectrometer	E329  Vancouver - Environmental	Water	APHA 2120 C (mod)	Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method. Colour measurements can be highly pH dependent, and apply to the pH of the sample as received (at time of testing), without pH adjustment.
Total Cyanide by CFA	E333  Vancouver - Environmental	Water	ISO 14403 (mod)	Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.
WAD Cyanide by CFA	E336  Vancouver - Environmental	Water	APHA 4500-CN I (mod)	Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.
Free Cyanide by CFA	E339  Vancouver - Environmental	Water	ASTM D7237 (mod)	Free cyanide is determined by in-line gas diffusion at pH 6 with final determination by colourimetric analysis.
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L  Vancouver - Environmental	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO <sub>2</sub> . NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Organic Carbon by Combustion (Low Level)	E358-L  Vancouver - Environmental	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO <sub>2</sub> . NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Nitrogen by Colourimetry	E366  Vancouver - Environmental	Water	APHA 4500-P J (mod)	Total Nitrogen is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U  Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level)	E378-U  Vancouver - Environmental	Water	APHA 4500-P E (mod)	Dissolved Orthophosphate is determined colourimetrically on a water sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Metals in Water by CRC ICPMS	E420  Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.  Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L  Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.
Dissolved Metals in Water by CRC ICPMS	E421  Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS.  Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L  Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Total Mercury in Water by CVAAS	E508  Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Dissolved Mercury in Water by CVAAS	E509  Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
VH and F1 by Headspace GC-FID	E581.VH+F1  Vancouver - Environmental	Water	BC MOE Lab Manual / CCME PHC in Soil - Tier 1 (mod)	Volatile Hydrocarbons (VH and F1) is analyzed by static headspace GC-FID. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
BC PHC - EPH by GC-FID	E601A  Vancouver - Environmental	Water	BC MOE Lab Manual	Extractable Petroleum Hydrocarbons (EPH) are analyzed by GC-FID.
BTEX by Headspace GC-MS	E611A  Vancouver - Environmental	Water	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
PAHs by LVI GC-MS	E641A  Vancouver - Environmental	Water	EPA 8270E (mod)	Polycyclic Aromatic Hydrocarbons (PAHs) are analyzed by large volume injection (LVI) GC-MS.
Dissolved Hardness (Calculated)	EC100  Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO <sub>3</sub> ), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO <sub>3</sub> equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A  Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO <sub>3</sub> ), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO <sub>3</sub> equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
VPH: VH-BTEX-Styrene	EC580A  Vancouver - Environmental	Water	BC MOE Lab Manual (VPH in Water and Solids) (mod)	Volatile Petroleum Hydrocarbons (VPH) is calculated as follows: VPHw = Volatile Hydrocarbons (VH6-10) minus benzene, toluene, ethylbenzene, xylenes (BTEX) and styrene.
LEPH and HEPH: EPH-PAH	EC600A  Vancouver - Environmental	Water	BC MOE Lab Manual (LEPH and HEPH) (mod)	Light Extractable Petroleum Hydrocarbons (LEPH) and Heavy Extractable Petroleum Hydrocarbons (HEPH) are calculated as follows: LEPH = Extractable Petroleum Hydrocarbons (EPH10-19) minus Acenaphthene, Acridine, Anthracene, Fluorene, Naphthalene and Phenanthrene; HEPH = Extractable Petroleum Hydrocarbons (EPH19-32) minus Benz(a)anthracene, Benzo(a)pyrene, Fluoranthene, and Pyrene.
Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Digestion for TKN in water	EP318  Vancouver - Environmental	Water	APHA 4500-Norg D (mod)	Samples are digested using block digestion with Copper Sulfate Digestion Reagent.
Digestion for Total Nitrogen in water	EP366  Vancouver - Environmental	Water	APHA 4500-P J (mod)	Samples are heated with a persulfate digestion reagent.

<i>Preparation Methods</i>	<i>Method / Lab</i>	<i>Matrix</i>	<i>Method Reference</i>	<i>Method Descriptions</i>
Digestion for Total Phosphorus in water	EP372  Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421  Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO <sub>3</sub> .
Dissolved Mercury Water Filtration	EP509  Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.
VOCs Preparation for Headspace Analysis	EP581  Vancouver - Environmental	Water	EPA 5021A (mod)	Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler. An aliquot of the headspace is then injected into the GC/MS-FID system.
PHCs and PAHs Hexane Extraction	EP601  Vancouver - Environmental	Water	EPA 3511 (mod)	Petroleum Hydrocarbons (PHCs) and Polycyclic Aromatic Hydrocarbons (PAHs) are extracted using a hexane liquid-liquid extraction.

## QUALITY CONTROL REPORT

**Issue Date** : 09-Sep-2020 12:43

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

### *Signatories*

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Laboratory Department</i>
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Brianna Allen	Department Manager Organics	Organics, Burnaby, British Columbia
Bruna Botti	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Caitlin Macey	Team Leader Inorganics	Inorganics Water Quality, Burnaby, British Columbia
Cristina Alexandre	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Jashan Kaur	Lab Assistant	Metals, Burnaby, British Columbia
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Kim Jensen	Department Manager Metals	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Miles Gropen	Department Manager Inorganics	Inorganics Water Quality, Burnaby, British Columbia
Richard Chong		Metals, Burnaby, British Columbia
Robin Weeks	Team Leader Metals	Metals, Burnaby, British Columbia
Shaneel Dayal	Analyst	Metals, Burnaby, British Columbia

## **General Comments**

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO = Data Quality Objective.

LOR = Limit of Reporting (detection limit).

RPD = Relative Percentage Difference

# = Indicates a QC result that did not meet the ALS DQO.

### Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: <b>Water</b>					Laboratory Duplicate (DUP) Report

## Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

## Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

## Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level  $\geq 1 \times$  spike level.

Sub-Matrix: **Water**

## APPENDIX G PERMIT PR-7927 ANNUAL STATUS REPORT

# Annual Status Form

AUTHORIZATION NUMBER: 7927

AUTHORIZATION TYPE: Refuse, Permit

LEGAL AUTHORIZATION HOLDER NAME: SnipGold Corp.

AUTHORIZED PERSON NAME: Jessy Chaplin

AUTHORIZED PERSON SIGNATURE: 

SIGNATURE DATE: March 31, 2021

*I understand that it is an offense to mislead a government official, and I declare that all of the information presented is accurate and true. I have been given the authority by the authorization holder to sign this form.*

CONDITION NUMBER	CONDITION DESCRIPTION	COMPLIANT? (Yes/No/ND)	ACTION TAKEN
1.1.1	The maximum authorized volume of solid waste that can be discharged is 38,000 m <sup>3</sup>	Yes	The landfill was not active in 2020.
1.1.2	The authorized discharge period is continuous between the years 2018 to 2022 snow free seasons.	Yes	N/A
1.1.3	The Authorized Works are the Main Landfill.	Yes	N/A
1.1.4	The permittee must not discharge under this authorization unless the Authorized Works are complete and fully operational.	Yes	N/A
1.1.5	The location of the facilities from which the discharge is authorized to originate is the non-operating Johnny Mountain Mine. The point of discharge is the Main Landfill located at latitude 56° 04' 28" and longitude 131° 37' 57".	Yes	N/A
1.2.1	The maximum authorized rate of discharge is indeterminate.	Yes	N/A
1.2.2	The characteristics of the emissions must be typical of those originating from the regulated open burning of wood waste, cardboard, paper and paper products.	Yes	No open burning took place on site in 2020
1.2.3	The location of the facilities from which the discharge is authorized to originate and the point where the discharge is authorized to occur is the same as specified in subsection 1.2.5 above.	Yes	N/A
2.1	Authorization for the discharge of emissions from a properly designed auxiliary fired refuse incinerator that serves a remote industrial camp with a design capacity of less than 100 persons is through the Waste Discharge Regulation pursuant to the Environmental Management Act.	Yes	There is no incinerator or camp at Johnny Mountain Mine.
2.2	The permittee must not open burn waste which is unacceptable to the director. Unacceptable materials include nuisance causing combustibles such as painted and treated wood, rubber, plastics, tars, asphalt shingles, roofing material, insulation, etc. Acceptable materials include unpainted, untreated demolition and construction wood wastes, broken lumber and pallets, slabs, log ends and branches, brush and miscellaneous, non-recyclable cardboard and paper products.	Yes	SnipGold separates waste for landfill and authorized waste for burning. No waste was placed in the Main Landfill in 2020 and no open burning occurred in 2020.
2.3	The permittee must incorporate the residue of combustion from a burn into the landfill authorized in subsection 1.1 or a landfill authorized by the director once such residue has cooled to ambient temperature.	Yes	No open burning occurred on site in 2020.

Authorized Person Initial: 

Date: March 31, 2021

CONDITION NUMBER	CONDITION DESCRIPTION	COMPLIANT? (Yes/No/ND)	ACTION TAKEN
2.5.1	The permittee must regularly inspect the Authorized Works and maintain them in good working order. If components of the Authorized Works have a manufacturer's recommended maintenance schedule, then those components must, at a minimum, be maintained in accordance with that schedule. The permittee must maintain a record of inspections and maintenance of the Authorized Works, and make the record available to an officer upon request.	Yes	As no construction occurred on site in 2020, Wood completed the erosion and sediment control measures inspection at the Main Landfill in 2020. No additional inspections of Authorized Works were conducted in 2020. The landfill was not active in 2020.
2.5.2	In the event of an emergency or other condition which prevents normal operation of the Authorized Works or leads to an unauthorized discharge, the permittee must take remedial action immediately to restore the normal operation of the Authorized Works and to prevent any unauthorized discharges. The permittee must immediately report the emergency or other condition and the remedial action that has and will be taken to the EnvironmentalCompliance@gov.bc.ca email address or as otherwise instructed by the director.	Yes	N/A
2.6	The permittee must cause a Qualified Professional to a. Certify all facilities and information, including works, plans, assessments, investigations, surveys, programs, and reports related to the design, and b. Seal all as-built drawings.	Yes	Wood have been contracted by SnipGold Corp. as the Qualified Professional for the Main Landfill Upgrades. Wood have completed the Post Construction Report - 2019 Main Landfill Upgrades report (Wood 2020), in which they document the inspections, reports and programs completed in relation to the landfill. Construction Inspections are provided in Appendix B and Construction Record Drawings are provided within Appendix A of the report. The Record Drawings incorporated findings from AllNorth's post-construction survey completed in September 2019.
2.7	The permittee must compact all refuse and confine such compacted refuse to the smallest practical area and volume at the operating face of the landfill. The permittee must apply a minimum 0.15 metre of cover material that is to the satisfaction of the director, on all exposed solid waste at least once per month while in use. The director may vary the frequency of covering when freezing conditions adversely affect normal operation or when sufficient quantities of soil material are incorporated with the waste.	Yes	The landfill was not active in 2020. Following their Main Landfill inspection, Wood recommended covering exposed materials in 2021.
2.8	The permittee must use the best practical means available to prevent the scatter of litter at the site. The permittee must clean up any litter scattered at a minimum of twice per year.	Yes	As no reclamation activities occurred on site in 2020, thus no litter was generated. Due to cleanup efforts by SnipGold from 2016-2020, most scattered litter has been removed. Additionally, SnipGold staff visited the site on October 7, 2020 and during the site visit collected and removed scattered litter (pers. Comm. Jessy Chaplin, 2020).
2.9	The permittee must apply final cover to all areas of the site that have reached final landfill elevations as soon as practical thereafter. Final cover requirements must be in accordance with the approved 2018 Johnny Mountain Mine TAR Chapter 3.2 Facility Design, Operation, and Closure Plan.	Yes	Final cover has not yet been applied as the landfill has not reached final capacity or elevation yet.
2.10	The director may require the permittee to construct or modify works, or follow specific operating instructions, if the director is of the opinion that there is a possibility of a nuisance or hazard being caused by bears or other animals that are attracted to the site.	Yes	No wildlife incidents were recorded in 2020.
2.11	The permittee must not deposit or store waste at the site at less than 1.22 metres above the highest groundwater level at the site.	Yes	Fill from Borrow Area 3 was placed in the Main Landfill to provide site grading to keep water from contacting the buried waste, including providing a minimum 1.22 m (4 feet) separation from groundwater (Post Construction Report - 2019 Main Landfill Upgrades report (Wood 2020)). No material was added to the Landfill in 2020.

Authorized Person Initial: 

Date: Mar 31, 2021

CONDITION NUMBER	CONDITION DESCRIPTION	COMPLIANT? (Yes/No/ND)	ACTION TAKEN
2.12	The permittee must comply with all applicable provisions of the Hazardous Waste Regulation of the Environmental Management Act when handling and disposing any hazardous waste generated during the mine reclamation. Hazardous waste as defined by the regulation is not authorized for discharge to the Main Landfill. Where conflict exists between this permit and the Hazardous Waste Regulation, the latter must take precedence.	Yes	No suspected hazardous/hazardous waste was identified in 2020.
2.13	Following the excavation of Burial Sites #1 and #2, the permittee must complete confirmatory soil sampling and analysis from the walls and floors of the excavations to confirm removal of all waste material. The confirmatory testing must be completed in a manner consistent with the Technical Guidance 1 on Contaminated Sites, "Site Characterization and Confirmation Testing". Results and interpretations of the confirmatory soil testing must be submitted as part of the annual report required by Section 3.	Yes	Disposal (Burial) Sites #1, #2 and undocumented Disposal Site #3 were fully excavated in 2018. Confirmatory Soil sampling was conducted and reported on in the 2018 Iskut Project/JMM Annual Reclamation Report. Northwest Response completed both the excavation and relocation of the waste and the confirmatory sampling.
2.14	At the start of the reclamation activities the permittee must develop, implement and then maintain erosion prevention and sediment control measures. Each snow-free season, until the end of the authorization provided in section 1.1, a Qualified Professional must assess whether those controls are being undertaken and are effective. That assessment, including recommended updates to the control measures, must be submitted as part of the annual report required by section 3.	Yes	In 2019 a QP from Wood assessed the Main Landfill sediment erosion controls and found them to be effective (Post Construction Report - 2019 Main Landfill Upgrades report (Wood 2020))
2.15	The permittee must annually monitor groundwater and surface water downslope from the Main Landfill for a period of five years, starting in summer 2018. Monitoring sites include MW17-22A, MW17-22B and Sky Creek 1.0. Results and interpretations of the water monitoring program specified above must be submitted as part of the annual report required by section 3.	Yes	Ground and surface water was monitored at MW17-22A, MW17-22B and Sky Creek 1.0 (JM10-2018) during the 2020 season. Results are presented in the JMM Annual Report for 2020: Environmental Management Act Permit PR-7927.
3	The permittee must, on or before each March 31 that occurs during the term of this Authorization, submit such data, operating and discharge periods for the preceding calendar year to the director, by email at EnvAuthorisationsReporting@gov.bc.ca or as otherwise instructed by the director, in a form that is tabulated, graphically represented and interpreted to the satisfaction of the director.	Yes	N/A
4.1	The permittee must immediately notify the director or designate by email at EnvironmentalCompliance@gov.bc.ca, or as otherwise instructed by the director of any non-compliance with the requirements of this Authorization by the permittee and take remedial action to remedy any effects of such non-compliance. The permittee must provide the director with written confirmation of all such non-compliance events, including available test results within 24 hours of the original notification by email at EnvironmentalCompliance@gov.bc.ca, or as otherwise instructed by the director.	Yes	No non-compliances related to Permit PR-7927 occurred in 2020.

Authorized Person Initial: \_\_\_\_\_

Date: Mar 31, 2021

CONDITION NUMBER	CONDITION DESCRIPTION	COMPLIANT? (Yes/No/ND)	ACTION TAKEN
4.2	If the permittee fails to comply with any of the requirements of this Authorization, the permittee must, within 30 days of such non-compliance, submit to the director a written report that is satisfactory to the director and includes, but is not necessarily limited to, the following: a. All relevant test results obtained by the permittee related to the non-compliance, b. An explanation of the most probable cause(s) of the non-compliance, and c. A description of remedial action planned and/or taken by the permittee to prevent similar non-compliance(s) in the future. The permittee must submit all non-compliance reporting required to be submitted under this section by email at EnvironmentalCompliance@gov.bc.ca or as otherwise instructed by the director.	Yes	No non-compliances related to Permit PR-7927 occurred in 2020.
5	The permittee must immediately report all spills to the environment (as defined in the Spill Reporting Regulation) in accordance with the Spill Reporting Regulation, which among other things, requires notification to Emergency Management BC at 1-800-663-3456.	Yes	No reportable spills were recorded on site in 2020

APPENDIX H      2008 ENV OFFICIAL WARNING LETTER ISSUED TO  
SKYLINE GOLD CORPORATION

The Best Place on Earth

June 11, 2008

File: PR-7927

**REGISTERED MAIL**

JIM SMULDERS  
PRESIDENT  
SKYLINE GOLD CORPORATION  
SUITE 212 - 10451 SHELLBRIDGE WAY  
RICHMOND BC V6X 2W8

**OFFICIAL WARNING – UNAUTHORIZED BURNING AND BURIAL OF WASTE**

During a meeting of the Northwest Mine Development Review Committee on March 27, 2008, Skyline Gold Corporation disclosed information regarding reclamation activities that were undertaken at the Johnny Mountain Mine in 2007. Buildings were reported to have been burned and demolition materials and scrap metals were reported to have been buried on site.

Authorization under the *Environmental Management Act* is required for scheduled activities as defined in the Waste Discharge Regulation. Burning of Waste is a Schedule 1 activity, and an Industrial Non-hazardous Waste Landfills is a schedule 2 activity. No authorization for the above reclamation activities was obtained in 2007.

You are warned that you are in non-compliance with Section 6(3) of the *Environmental Management Act*, which states: "A person must not introduce or cause or allow to be introduced into the environment, waste produced by a prescribed activity or operation" without authorization from a permit, approval, order or through compliance with a regulation.

In order to determine if pollution may occur from the buried demolition debris from the Johnny Mountain Mine under Mine Reclamation Permit M-178, legally described as District Lots 7031 and 7032, Cassiar District, owned and/or operated by SKYLINE GOLD CORPORATION, of Suite 212, 10451 SHELLBRIDGE WAY, RICHMOND, BRITISH COLUMBIA, the ministry requires Skyline Gold Corporation undertake the following:

1. Obtain a qualified professional to complete a site investigation and oversee any remedial actions required to bring the site in compliance with the *Environmental Management Act* and its associated legislation. Forward the name of the selected qualified professional to the Manager, Environmental Protection Division, Ministry of Environment (MOE), Skeena Region, by June 30, 2008.

2. The site investigation must include the following:
- i. Provide a detailed summary of all activities undertaken in 2007 related to reclamation of the Johnny Mountain Mine site – including: the locations, estimated volumes and descriptions of all materials burned, description of all waste materials and approximate volumes of materials buried on site, and a description of any materials removed from site as well as the location(s) the materials were moved to.
  - ii. Itemize all hazardous wastes as defined in the Hazardous Waste Regulation that were on site as of October 13, 1999, and detail the disposal of the items, including: copies of all relevant records that confirm the fate of the hazardous materials. Any hazardous wastes remaining on site or buried on site must be identified and a plan prepared detailing proper disposal for the wastes.
  - iii. Carry out field investigations, which includes test pitting and trenching, to confirm the following:
    - location of all buried waste/disposal sites;
    - the materials buried;
    - an estimated volume of waste buried at each location;
    - the depth of the bottom of the trench;
    - depth of cover over the buried materials; and
    - to characterize the site conditions around the disposal sites including:
      - a. a description of the overburden and underlying bedrock;
      - b. depth to the seasonal high water table;
      - c. approximate direction of groundwater flow; and
      - d. distances to nearby surface water bodies from the disposal areas.
  - iv. Provide detailed maps showing all locations of buried materials on site, and indicating approximate volumes of waste at each location. Maps must show contours, water courses, and outlines of the disposal locations.
  - v. Assess the suitability of the disposal areas in comparison with “British Columbia Landfill Criteria for Municipal Solid Waste”. Detail any sites not meeting the criteria and identify suitable alternative sites for disposal.
  - vi. Submit the above information in a site investigation report to the Manager, Environmental Protection Division, MOE, Skeena Region, by August 15, 2008.
3. Relocation of unsuitably buried materials identified in the site investigation report will be required. The material must be reburied at locations approved by the Ministry of Environment and the Ministry of Mines, Energy and Petroleum Resources. Burial of the

relocated materials shall be in a manner approved in writing by the Ministry of Environment.

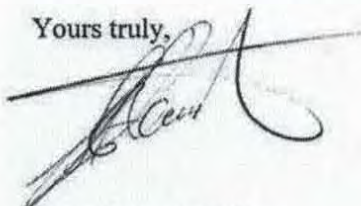

4. Any hazardous wastes found buried, or remaining on site, must be properly disposed of in an authorized facility. Copies of the manifests shall be submitted to the Manager, Environmental Protection Division, MOE, Skeena Region, following delivery of the wastes to the disposal facility. Removal of any remaining hazardous wastes shall be completed by September 15, 2008.

Failure to comply with the requirements of this letter will lead to escalating enforcement and may result in legal action.

It is your responsibility to ensure that all activities are carried out with due regard for the rights of third parties, and comply with other applicable legislation, such as the *Mines Act* and the *Heritage Conservation Act*, that may be in force.

If you have any questions, please call me at 250-847-7416.

Yours truly,

Craig Stewart, P. Geo.  
For Director, *Environmental Management Act*  
Environmental Protection – Skeena Region

## APPENDIX I      COMMUNICATION WITH B. VROOM (2021)

**From:** Carey deHoog <[Carey@seabridgegold.com](mailto:Carey@seabridgegold.com)>  
**Sent:** March 4, 2021 4:13 PM  
**To:** Jessy Chaplin <[jessy@seabridgegold.com](mailto:jessy@seabridgegold.com)>  
**Cc:** Elizabeth Miller <[elizabeth@seabridgegold.com](mailto:elizabeth@seabridgegold.com)>; Lionel Sequeira <[lionel@seabridgegold.com](mailto:lionel@seabridgegold.com)>  
**Subject:** FW: PR 7927 (Johnny Mountain) - can you help or point me in the right direction?

Hi Jessy,

I'm not sure where to go with this one now. This response is a bit frustrating..... Bryan called this afternoon (Mark forwarded the request to him). When we spoke he mentioned the 2020 non-compliance and I thought I was pretty clear in asking him not to confuse the two issues and that I was looking for a response on the 2008 warning letter.

Bryan wasn't familiar with the past issues or annual reports but did read the 2008 letter. I don't think he looked at the report from Northwest Response even though I requested he do so. I am wondering if following up with "J Green" (from 2019 ARR reference) is a better approach. Getting passed on to different people in their Ministry is certainly not helping! It seems no one wants to take the time to acknowledge the work Seabridge has done!

We can talk more about this at tomorrow's meeting.

~Carey

Hi Carey,

Thanks for returning my call earlier. As discussed there was a data review inspection completed last spring where it was determined that an unauthorised discharge occurred with burning of waste fuel. I have attached the 2020 inspection records for your convenience along with an inspection record from 2015. I have also included the final Administrative Penalty determination letter from July 2020 that arose from the unauthorised burning of waste fuel.

You have asked that the Ministry 'sign off' that the actions stated in a June 11, 2008 warning letter related to unauthorised burial of waste and related contamination are complete. The activities to remove buried waste and related contamination are described in the 2019 annual report that was submitted in 2020. I cannot 'sign off' on the remediation activities. What I can say is that the ministry does not anticipate further inspections on the matters referred to in the 2008 warning letter at this time, but there is no limitation on our ability to do so. You are reminded that it is the responsibility of the waste discharger to comply with the *Environmental Management Act* (EMA) and its regulations, including the Contaminated Sites Regulation.

Best regards.

Hi Mark,

Thanks for returning my call. As discussed, please see attached letter from 2008 where the original order was issued. In reading it again, it seems to be an official warning but the content of the letter does indicate an action by SnipGold. It was originally issued by Craig Stewart (not Jim, my mistake).

Thanks again for following up with your compliance team. It would be great to have a response from MOE stating that the clean up work is to the satisfaction of the Ministry for this year's annual report.

**Subject:** PR 7927 (Johnny Mountain) - can you help or point me in the right direction?

Good morning Mark!

It's been such a long time since I've seen you! I am now working for Seabridge Gold – made the jump to industry early this year.

I wonder if you would be able to point me in the right direction? I am looking to find a response from MOE on the 2018 cleanup work that was done by SnipGold following unauthorized burial of waste in burial sites 1 & 2 (form 2008) at the Johnny Mountain site.

The response we received in early 2020 indicated a desktop inspection would likely take place last year (2020) as no onsite inspections were being done during the pandemic. This response came from J. Green and mentioned 'the Officer conducting the inspection' would be in touch.

Are you able to tell me who that would be so I can follow up with them? We are looking to close off this piece for the 2020 Annual Report.

Thanks!

## EXECUTIVE SUMMARY

The Johnny Mountain Mine is a closed underground gold mine located in the Coast Mountain Range of British Columbia, approximately 100 km northwest of Stewart, BC. The site is situated on a sub-alpine plateau surrounded by steep valleys, and is located near the confluence of the Craig and Iskut rivers. The northwest face of Johnny Mountain is covered by an alpine glacier.

Snip Gold Corporation (SnipGold), a subsidiary of Seabridge Gold Inc., acquired the property on June 21, 2016. Hydrometric stations were established for the open-water season at two locations receiving discharge or seepage from the tailing storage facility (TSF) in 2016. In 2017, these two stations were re-established in the same location, and seasonal hydrometric monitoring was extended to the three portal locations on site. For 2018, seasonal hydrometric monitoring continued at the locations monitored in 2017. In 2019, all stations were re-established and monitoring of the level 10 portal was consolidated into one location due to the completion of reclamation work on the portal. In 2020, the stations were re-established and the current status of monitoring discharge from the portals is a single hydrometric location at each of the level 10, level 11, and level 12 portals.

The objective of the 2020 program was to continue monitoring the water discharging/seeping from the Johnny Mountain TSF (two locations) and three portal discharge locations (level 10, level 11, and level 12 portals). Both automated and manual monitoring methods were used. Automated hydrometric monitoring stations were installed at the two TSF locations and at the level 10 portal. The level 11 and level 12 portal locations are not amenable to installing hydrometric stations due to minimal discharge volumes, and discharge at these locations was measured using manual measurements. Stage-discharge rating measurements were completed at each station and rating curves were developed. The rating curves were applied to the stage data and hydrographs for the monitoring period generated for the three stations.

This report presents the results from the 2020 hydrometric monitoring of the TSF and portal stations. Section 2 presents the methodology used for the fieldwork and the analyses, Section 3 presents the results and a short summary. Raw data are included as appendices to this report.

## ACRONYMS AND ABBREVIATIONS

7-day low flow	The minimum 7-day-average flow that occurs over a specific period, such as a month, season or year
Baseflow	The groundwater component of flow discharge that is attributed to soil moisture and groundwater drainage into a channel
BC	British Columbia
ERM	ERM Consultants Canada Ltd.
Freshet	Streamflow response to snowmelt and spring rains
Hydrograph	A graphical plot of water discharge versus time
ISO	International Organization for Standardization
kg	Kilogram
km	Kilometre
km <sup>2</sup>	Square Kilometre
m	Metre
MAD	Mean annual discharge
MASL	Meters above sea level
mm	Millimeter
m/s	Meters per second, a unit of velocity
m <sup>3</sup> /s	Meters cubed per second, a unit of discharge
NAD83	North American Datum 1983, geodetic reference system
Q	Discharge
QA/QC	Quality assurance/ quality control
RISC	Resources Information Standards Committee

RTEC	Rescan Tahltan Environmental Consultants. A partnership between the Tahltan Nation Development Corporation and Rescan Environmental Services Ltd. (now ERM)
Runoff	Runoff is a measure of the hydrological response of a watershed. It is often presented as a depth, in mm, over a n entire watershed allowing direct comparison with precipitation totals
R <sup>2</sup>	Root mean square
Seabridge	Seabridge Gold Inc.
SnipGold	SnipGold Corporation, a subsidiary of Seabridge Gold Inc. acquired the Iskut Project on June 21, 2016
Stage	Elevation of water surface above a datum
Stage-Discharge Curve (Rating Curve)	A curve derived from concurrently measured water level (stage) and flow (discharge) data; often referred to as a rating curve for a hydrometric station
TSF	Tailings Storage Facility
UTM	Universal Transverse Mercator coordinate system, uses NAD 83 reference system
Watershed	The geographical area drained by a river and its tributaries; an area characterized by all runoff being conveyed to the same outlet.
WSC	Water Survey of Canada

## 1. INTRODUCTION

The Johnny Mountain Mine is a closed underground gold mine located in the Coast Mountain Range of British Columbia, approximately 100 km northwest of Stewart, BC (Figure 1-1). The site is situated on a sub-alpine plateau surrounded by steep valleys, and is located near the confluence of the Craig and Iskut rivers. The northwest face of Johnny Mountain is covered by an alpine glacier.

Snip Gold Corporation (SnipGold), a subsidiary of Seabridge Gold Inc., acquired the property on June 21, 2016. In July 2016, RTEC conducted a site visit along with SnipGold in order to determine potential hydrological monitoring locations around the Tailings Storage Facility (TSF). Two hydrometric monitoring stations were established later in the summer of 2016 in order to monitor the passive surface water overflow of the TSF (northeast side) and low volume seepage from the southwest side of the TSF. The stations were removed prior to the streams freezing.

In 2017, the two TSF hydrometric stations were re-installed, two new stations were established to monitor discharge from the level 10 portal, and discharge measurements were collected at level 11, and level 12 portals.

For 2018, hydrometric monitoring was continued at the 2017 locations.

For 2019, hydrometric monitoring was continued at the 2018 locations, with the exception of a single consolidated station at the level 10 portal due to the completion of reclamation activities. During the late summer of 2018, the secondary level 10 portal was decommissioned, resulting in a single discharge from the reclaimed portal.

For 2020, hydrometric monitoring was continued at the 2019 locations.

This report presents the results from the 2020 hydrometric monitoring of the TSF and portal stations. Section 2 presents the methodology used for the fieldwork and the analyses, Section 3 presents the results and a short summary. Raw data are included as appendices to this report.

**Figure 1-1  
Project Location**

## 2. METHODS

### 2.1 General Overview

The 2020 program focussed on water originating from the TSF and three portals (level 10, level 11, and level 12), which are located on the plateau at approximately 1,100 masl, and on the slope of Johnny Mountain immediately above the plateau (Figure 2.1-1).

Water from the TSF flows into two drainage systems:

#### 1. Northeast:

On the northeast side water is passively discharged from the TSF via an overflow spillway and monitored at hydrometric station JTN-H1. The overflow water from the TSF is directed to Johnny Creek, which enters Bronson Creek before draining into the Iskut River.

#### 2. Southwest:

On the southwest side, small volumes of water are collected into a drainage ditch and monitored at hydrometric station JTS-H1. This small water volume reflects rain, snowmelt, and seepage from the TSF. Seepage water on the southwest side of the TSF and the discharge from the three portals drain into upper Stonehouse Creek, which drains into the Craig River. The Craig River flows into the Iskut River approximately 10 km downstream of where Bronson Creek enters the Iskut River.

The Iskut River flows west, joining the Stikine River which discharges into the Pacific Ocean near Wrangell, Alaska, approximately 80 km west of the Johnny Mountain site.

### 2.2 Overview of 2020 Field Program

The 2020 field program was carried out between June and October 2020, with the overall objective of re-establishing and maintaining the two TSF and three portal hydrometric monitoring locations. The 2020 field program included:

- re-installing continuous hydrometric stations;
- collecting stage-discharge measurements;
- maintaining station instrumentation; and
- downloading data.

The first site visit was conducted in mid-June (Photo 2.2-1). This site visit included re-installation of two hydrometric stations: one station for the TSF discharge/seepage location (JTS-H1), and one station for the level 10 portal location (P10-A). Due to the depth of snow present at the time of the June site visit and inclement weather hindering safe access to the plateau, hydrometric station JTN-H1 could not be re-installed at that time and was re-installed in July. The level 11 and level 12 portal locations are not amenable to installing hydrometric stations due to minimal discharge volumes each year. Discharges at these locations are measured using manual measurements rather than automated measurements (hydrometric stations). Figure 2.1-1 shows the locations of the monitoring stations and Table 2.2-1 provides station details.

There were five site visits in total in 2020, the dates of each site visit is presented in Table 2.2-1.

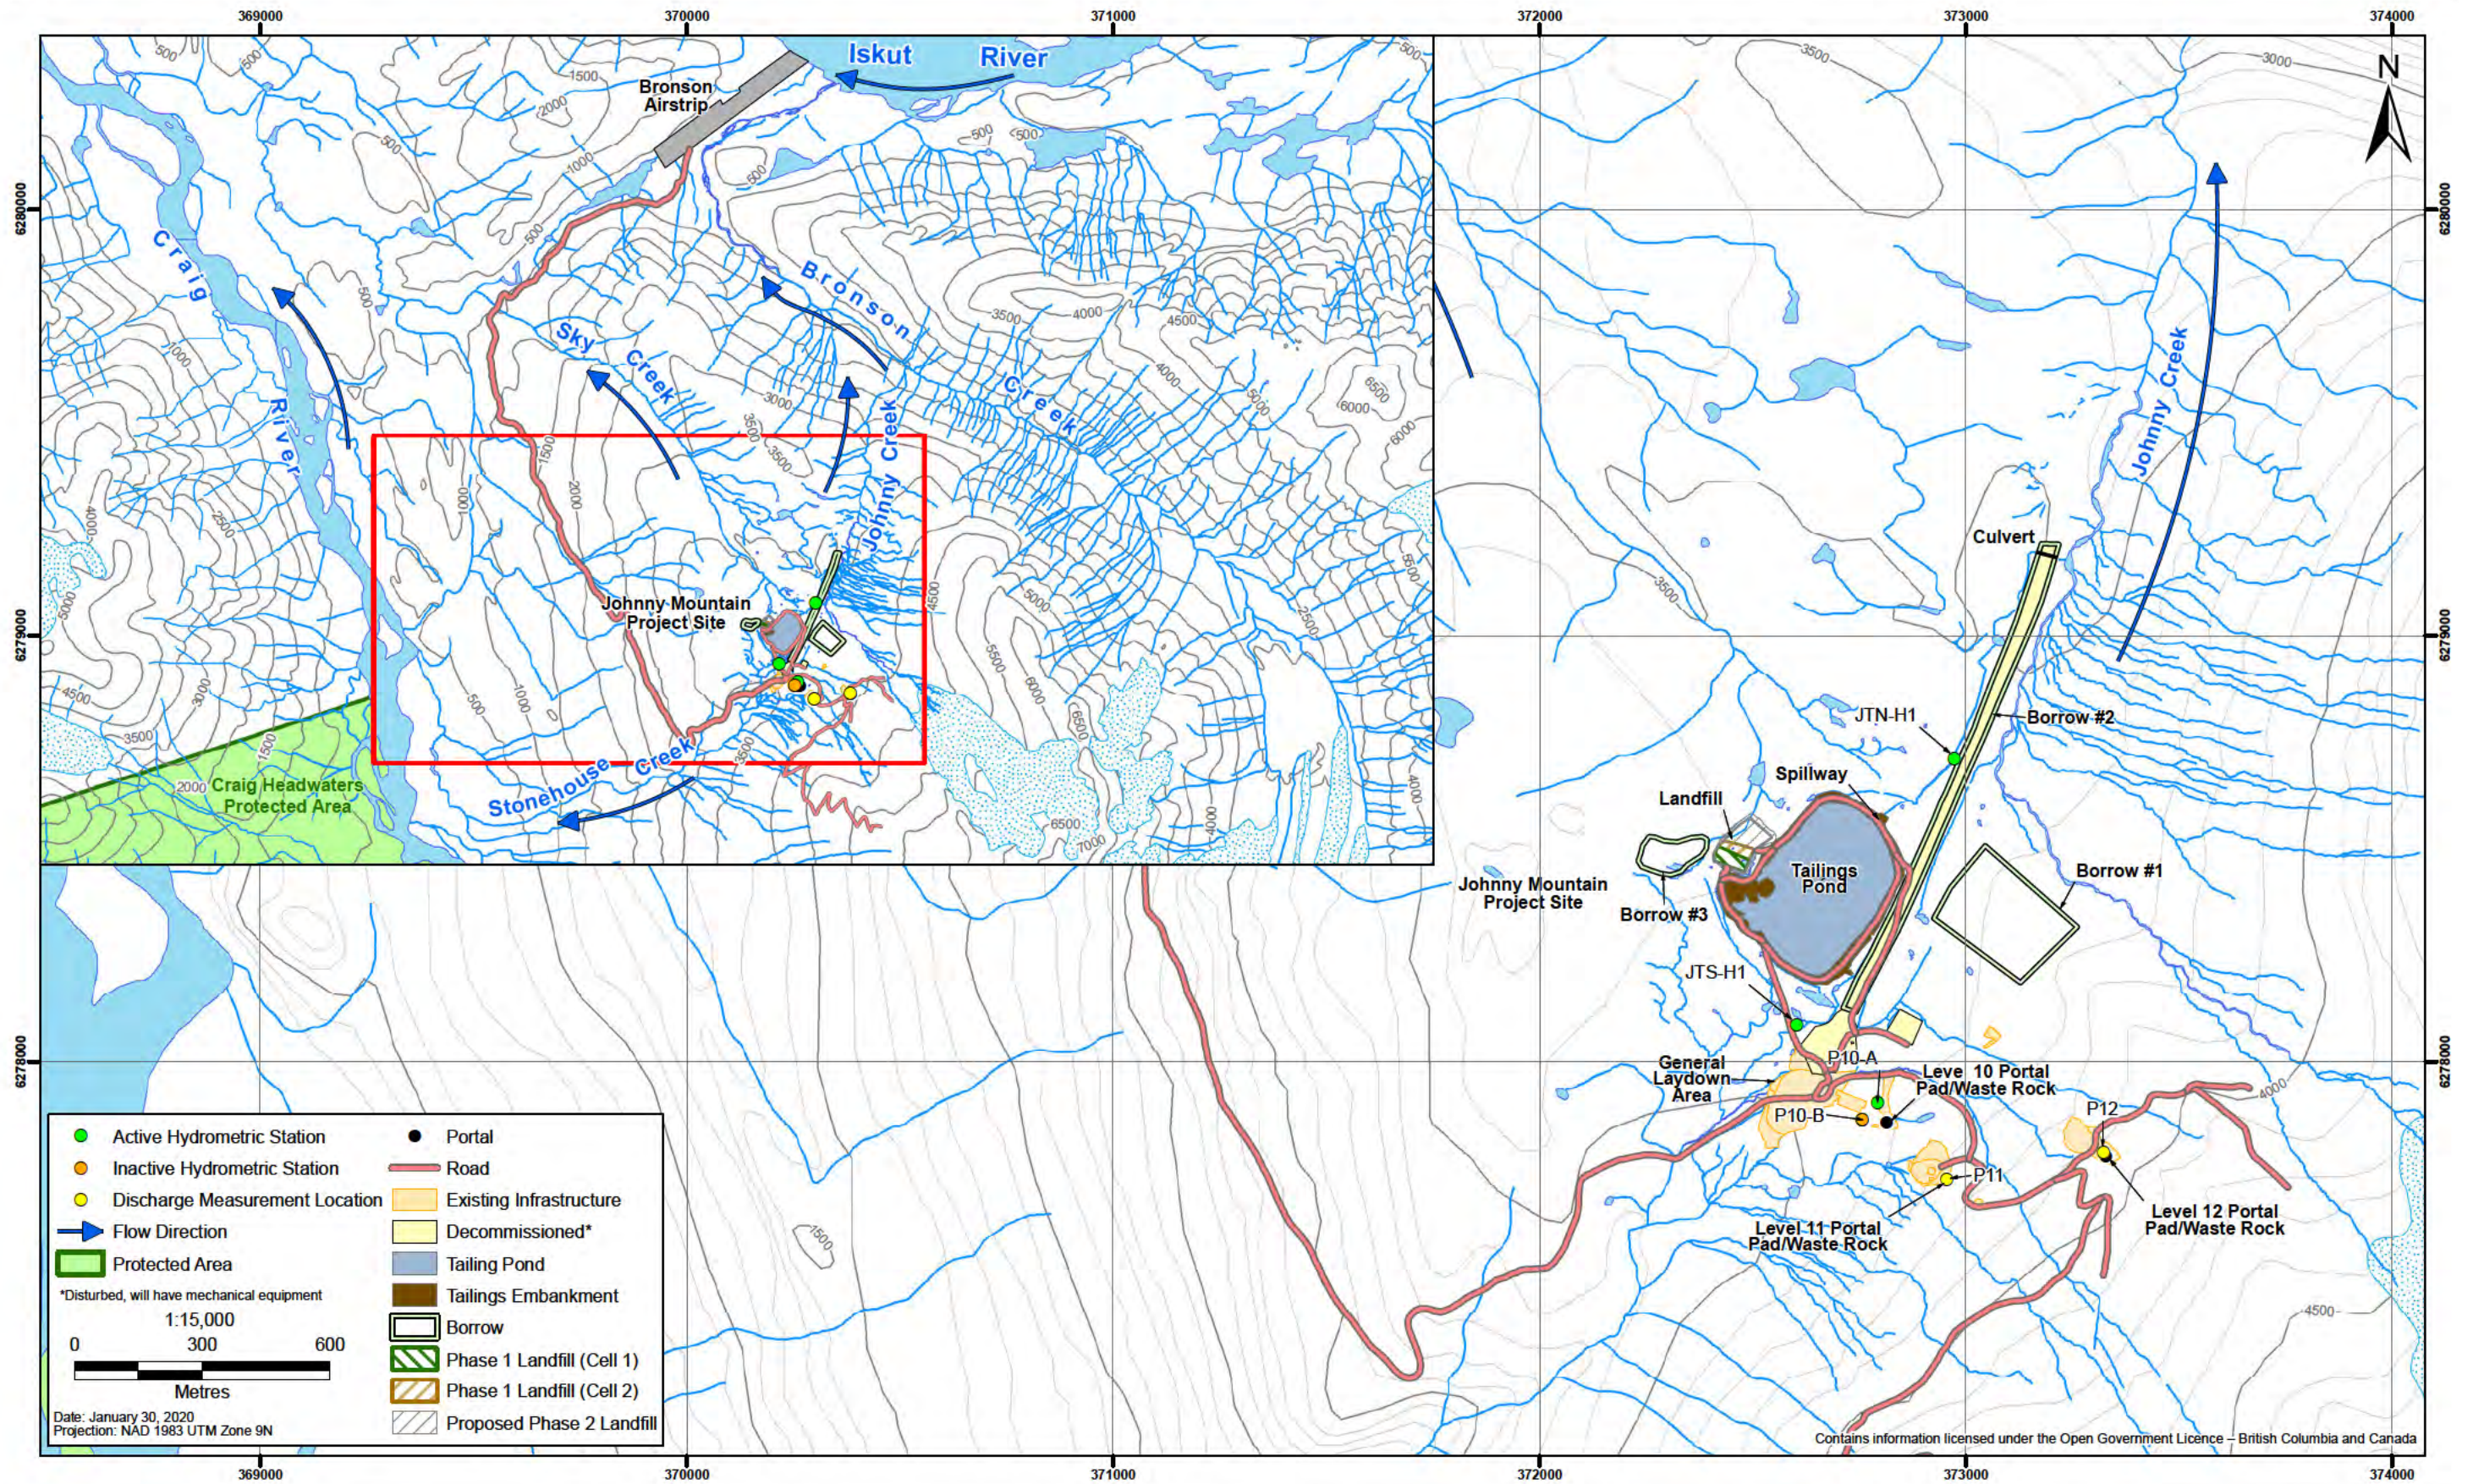

Photo 2.2-1: Snow conditions near the TSF in June. June 14, 2020.

Table 2.2-1: 2020 Tailings Storage Facility and Portal Hydrometric Monitoring Stations

Station	Location	Easting	Northing	Period of Operation
JTS-H1	Downstream of seepage. Small stream ~100 m southwest of the TSF. Discharges into Stonehouse Creek.	372,609	6,278,081	Sep 24 - Oct 24 (2016) Apr 28 - Jun 22 (2017) Jun 9 - Oct 21 (2018) Jun 27 - Oct 31 (2019) Jun 14 - Oct 17 (2020)
JTN-H1	Downstream of passive spillway. Small stream ~230 m northeast of the TSF. Discharges into Johnny Creek.	372,973	6,278,720	Sep 24 - Oct 24 (2016) Jul 8 - Oct 24 (2017) Jun 10 - Oct 21 (2018) Jun 27 - Oct 31 (2019) Jul 9 - Sep 24 (2020)
P10-A	Level 10 portal discharge around the northeast side of the old mill building. Relocated in 2019 due to reclamation work to ~40 m downstream of portal discharge culvert.	372,802	6,277,921	Jun 9 - Oct 24 (2017) Jun 9 - Aug 29 (2018) Jun 27 - Oct 31 (2019) Jun 14 - Oct 17 (2020)

Figure 2.1-1  
Hydrometric Monitoring Stations

## 2.3 Hydrometric Station Setup

Stations JTS-H1 and JTN-H1 consisted of PS98i® 0-5 PSI vented pressure transducers (accuracies of  $\pm 0.25\%$  FSO) paired with GDL® data loggers (Instrumentation Northwest Inc.). The portal monitoring station P10-A consisted of a DI601 10 m Micro-Diver® pressure transducer (accuracies of  $\pm 1.0$  cmH<sub>2</sub>O with a 0.2 cmH<sub>2</sub>O resolution) with internal data logger paired with another DI601 10 m Micro-Diver acting as a barologger (Schlumberger Water Services). The instruments were set to record water level at ten minute intervals. A station information sheet for each monitoring location is presented in Appendix A.

### 2.3.1 Hydrometric Station JTS-H1 (Tailings Storage Seepage)

Hydrometric monitoring station JTS-H1 was re-established in the pool approximately 100 m southwest of the TSF where a series of seepage collection ditches converge into a single channel (Photo 2.3-1). The pressure transducer and cabling were inserted into a flexible aluminum conduit with one end of the conduit secured in an aluminum pipe. The aluminum pipe was then placed into the water and secured to a large boulder using threaded anchor rods and quick-setting epoxy. The data logger was housed in a steel waterproof enclosure that was secured to the boulder above the high water mark. The water elevation at the station is controlled by a small cobble outflow channel at the southwest end of the gauging pool (i.e., a section control).

Photo 2.3-1: Hydrometric monitoring station JTS-H1 (tailings storage seepage). August 20, 2019.

### 2.3.2 Hydrometric Station JTN-H1 (Tailings Storage Spillway)

Hydrometric monitoring station JTN-H1 was re-installed in the channel that originates in the spillway on the northeast side of the TSF. The station is located approximately 230 m northeast of the TSF where a series of seepage collection ditches converge into a single channel with the main spillway channel (Photo 2.3-2). The pressure transducer and cabling were inserted into a flexible aluminum conduit with one end of the conduit secured in an aluminum pipe. The aluminum pipe was installed at

a shallow angle, parallel to the ground surface, extending into the channel and secured to rebar pounded into the bank and bed. The data logger was housed in a steel waterproof enclosure that was secured on the channel bank above the high water mark. The water elevation at the station is controlled by the channel slope and bed material along the gauging reach (i.e., a channel control).

Photo 2.3-2: Hydrometric monitoring station JTN-H1 (TSF spillway). July 24, 2019.

### 2.3.3 Hydrometric Station P10-A (Level 10 Portal A)

Hydrometric monitoring station P10-A was re-installed in the channel that originates in the level 10 portal and flows northeast around the former mill building. The station is located in a pool 40 m downstream of the level 10 portal culvert outflow (Photo 2.3-3). Water level in the pool is controlled by the height of the pool's outflow. The pressure transducer was fixed to a piece of stationary rebar that was driven into the stream bed at the inflow of the pool. The barologger was fixed to a piece of stationary rebar that was driven into the ground beside the pool.

### 2.3.4 Monitoring Location P11 (Level 11 Portal)

A culvert was positioned during the 2017 reclamation work to capture the water discharging from the level 11 portal (Photo 2.3-4). The site was assessed for monitoring in 2017 and it was determined that establishing a continuous monitoring station was not feasible due to the minimal flow from the portal. In 2017 through 2020, manual volumetric discharge measurements were obtained at the site. In September 2020, the culvert was manually dug out and cleared during a site visit to collect manual volumetric discharge measurements.

*Photo 2.3-3: Hydrometric monitoring station P10-A (Level 10 Portal A), looking upstream, August 29, 2019.*

*Photo 2.3-4: Hydrometric monitoring location P11 (Level 11 Portal; discharge measurements only).  
September 25, 2020.*

### 2.3.5 Monitoring Location P12 (Level 12 Portal)

Similar to the reclamation work at P11, a culvert was positioned to capture the water discharging from the level 12 portal (Photo 2.3-5). The site was assessed for monitoring in 2017 and it was determined that establishing a continuous monitoring station was not feasible due to the minimal flow from the portal. In 2017 through 2020, manual volumetric discharge measurements were obtained at the site.

*Photo 2.3-5: Hydrometric monitoring location P12 (Level 12 Portal; discharge measurements only).  
September 24, 2020.*

## 2.4 Hydrometric Station Surveys

Pressure transducers can be subject to electronic drift and sensor fouling, presenting challenges for developing rating curves without a fixed elevation control. To establish and maintain a consistent elevation, all stage (i.e., the height of the water surface) data are referenced to an arbitrary (gauge) datum. The water surface is surveyed to this datum during station visits, allowing the continuous data to be post-processed and corrected to gauge height, as well as for fouling and sensor drifts to be removed.

The gauge datum is a critical concept in hydrometric monitoring. It is established using a series of benchmarks, which are physical installations, typically occurring within a network at each monitoring station. Concrete expansion bolts, secured into bedrock and/or large stable boulders near the monitoring station, are frequently used as benchmarks. Continuity of the gauge datum is assured through correct installation of benchmarks and completion of station surveys.

Assigning benchmark elevations, and thus the gauge datum, can be done in a variety of ways, but continuity throughout data collection is critical. Three bench marks were installed at each station (Table 2.4-1) above the maximum expected water level. One bench mark at each station was assigned to be the primary reference point, and given an arbitrary local elevation of 100.000 m. All bench marks and recorded water levels were referenced to the gauge datum, 100.000 m below the primary bench mark.

Table 2.4-1: Hydrometric Monitoring Station Benchmarks

Station	Benchmark	Elevation <sup>1</sup>	Benchmark Information
JTS-H1	BM 1	100.000	Concrete expansion bolt in bedrock outcrop ~25 m north (upstream) of station.
	BM 2	100.240	Concrete expansion bolt in bedrock outcrop ~25 m north (upstream) of station. ~5 m east of BM 1.
	BM 3	99.603	Concrete expansion bolt in boulder that data logger is secured on.
JTN-H1	BM 1	100.000	Concrete expansion bolt in bedrock outcrop ~80 m north (downstream) of station.
	BM 2	100.063	Concrete expansion bolt in bedrock outcrop ~80 m north (downstream) of station. ~5 m east of BM 2.
	BM 3	100.011	Concrete expansion bolt in bedrock outcrop ~80 m north (downstream) of station. ~5 m east of BM 3.
P10-A	BM 1	100.000	Concrete expansion bolt in bedrock outcrop ~15 m upstream of pressure transducer.
	BM 2	99.221	Concrete expansion bolt in bedrock outcrop ~1 m upstream of pressure transducer.
	BM 3	99.101	Concrete expansion bolt in bedrock outcrop beside pressure transducer on south shore of the TSF.

Note:

<sup>1</sup> Elevation is height (m) relative to the gauge datum, 100.000 m below the reference point (BM 1).

## 2.5 Discharge Measurements

Manual flow measurements were performed during the five site visits in 2020 to obtain a range of measured discharges under different flow conditions. Manual flow measurements were carried out at each site using one of two methods, depending on flow conditions:

- A hand-held current velocity meter: used to complete velocity-area measurements in the channels with sufficient flows.
- A volumetric method: used to measure discharge in channels where flows are too minimal for the velocity-area method.

### 2.5.1 Velocity-Area Measurements

The location of the measurement section was determined based on channel geometry and flow conditions at the time of measurement. Generally, the stream was measured along a straight reach near the monitoring station where the bed and flow conditions were relatively uniform. Areas with highly turbulent flow and/or immovable rocks were avoided where feasible. Current velocities were measured using a Hach FH950™ handheld electromagnetic current meter (velocity measurement accuracies of  $\pm 2\%$  of reading  $\pm 0.015$  m/s through the range 0 to 3.04 m/s). A fixed sampling interval of 40 seconds was selected for each velocity measurement, during which an average velocity was determined.

Measurements of velocity, depth, and distance across the channel were obtained (Photo 2.5-1) to determine the total stream discharge during each station visit. A minimum of 20 measurements are typically taken across the width of a channel, with the aim of having each vertical or observation interval accounting for less than 10% of the total discharge (RISC 2018). Where channels were too

narrow to obtain 20 vertical observations, technicians used a 5 cm spacing interval to obtain as many measurements as possible. This method assumes that the velocity measured at each vertical represents the mean velocity in that segment. During the velocity measurements, the water velocities were measured at 60% of the water depth, from water surface. The measurement at 60% of the water depth is generally accepted as representing the mean velocity of the vertical water column (Herschy 2009). In all cases, field methods adhered to the *Manual of British Columbia Hydrometric Standards* (RISC 2018) and Water Survey of Canada (WSC) operating procedures (Terzi 1981).

*Photo 2.5-1: Velocity-area discharge downstream of the JTN-H1 (TSF) monitoring station using a handheld velocity meter. June 27, 2019.*

### **2.5.2 Volumetric Measurement**

Volumetric measurements were conducted at two sites (P11 and P12) where flows were too minimal to submerge the current velocity meter and accurately measure discharge using the velocity-area method. Volumetric measurements were conducted at the outlets of the elevated culverts that discharge out of the portals (Photo 2.5-2). To determine discharge during each site visit, five consecutive measurements were conducted with the average being taken as the total discharge. Measurements were conducted using a collection receptacle, a stopwatch to measure the time and a graduated cylinder to determine the volume of water collected in the receptacle. Field methods adhered to the standard of having a difference between measurements within 5% when feasible (RISC 2018). In some instances, during and following extended periods of rainfall, groundwater discharges continuously increased during field measurement sampling and field measurements exceeded the standard of a 5% difference.

*Photo 2.5-2: Volumetric discharge measurement using a collection receptacle, a stopwatch to measure the time and a graduated cylinder to determine the volume of water collected in the receptacle. July 24, 2019.*

## 2.6 Rating Curve Development

Empirical relationships between measured stage and discharge (i.e., rating curves) were developed to provide a continuous record of the discharge at the monitoring sites (ISO 2010). Once the rating curve is established for a monitoring site, continuous stage data (i.e., stage data recorded at 10-minute intervals) can be converted into a continuous discharge data and presented as a discharge hydrograph. The quality of the discharge hydrograph depends on the quality of the rating curve. The quality of the rating curve depends on the following factors:

- amount of data;
- accuracy of data;
- distribution of the data points used to generate the curve; and
- hydraulic characteristics of the monitoring location.

Although a rating curve can potentially be developed with as few as two points, it is recommended to have a minimum of six (RISC 2018) or fifteen (ISO 2010) discharge measurements, well distributed through the range of flows, to properly develop a rating curve.

A minimum of five discharge measurements per year is recommended to meet “Grade A” standards for discharge data based on the *Manual of British Columbia Hydrometric Standards* (RISC 2018). Each additional stage-discharge measurement at varying flow conditions increases the range and robustness of the rating curve.

High discharge information often requires extrapolation beyond the range of the empirical field data used to generate the rating curve. Therefore, it is important to take measurements at high discharges to better define the upper end of the rating curve. The rating curve can also change from low flow periods to high flow periods due to seasonal influences, such as vegetation (Herschly 2009), or because of different channel geometries or hydraulic controls at low and high flow conditions. Rating curves are hydraulic functions expressed as an equation of the form:

$$Q = C (h - a)^b \quad (1)$$

where  $Q$  is the discharge ( $\text{m}^3/\text{s}$ ),  $C$  and  $b$  are dimensionless coefficients,  $h$  is the stage (water level; m), and  $a$  is the stage at zero flow (datum correction; m).

In accordance with industry standards, the practical development of the rating curves was completed using Aquarius™ Time Series Hydrologic Software (Aquatics Informatics Inc.). The software uses standard methods outlined by the United States Geological Survey and the International Organization for Standardization (Kennedy 1984, ISO 2010). The Aquarius™ interface allows the user to draw the rating curve in a logarithmic plot. Equation (1) is logarithmically transformed to equation (2), which is in the form of the equation of a straight line:

$$\text{Log } Q = \text{log } C + b \text{ log } (h - a) \quad (2)$$

The hydrometric technician can then determine characteristics that are evident in logarithmic plots and relate these to the type of control, the stream cross section, cross-section shape changes, and shifting control patterns (Sauer 2002). Root Mean Square (RMS) error, used by the Aquarius™ software as an overall measure of error of the stage-discharge relationship, is provided as an indicator of uncertainty. RMS error is a statistical parameter that describes how well the values predicted by the stage-discharge relationship fit or represent the observed data.

Rating curve uncertainty is critical in interpreting discharge records, and much of the uncertainty is associated with the extrapolation of the rating curve beyond field measurements. Guidelines suggest that 1.5 times (ISO 2010) or 2 times (Rantz et al. 1982) of the greatest manually measured discharge is the recommended limit of reliable extrapolation. All discharges obtained from curves extrapolated above the limit recommended by Rantz et al. 1982, are noted as having higher uncertainty in the daily discharge tables provided in Appendix B of this report.

## 2.7 Discharge Hydrographs

The measured discharge hydrographs were generated and presented as 10-minute and mean daily discharge. For the operational period, discharge was calculated at the 10-minute intervals by applying the developed rating curve equations to the recorded stage data; data from the data logger was first compensated to changes in barometric pressure using the data from the barologger. The 10-minute-interval discharge data were averaged over a 24-hour period to calculate mean daily discharge. The measured discharge hydrographs, presented as mean daily discharge, were then generated.

## 2.8 Quality Assurance and Quality Control

The hydrotechnical standards and methods employed during the program were consistent with standards published by the British Columbia Ministry of Environment and Climate Change Strategy (RISC 2018). These standards complement the national standards developed by the Environment Canada's Water Survey of Canada (WSC 1999).

RISC (2018) outlines three criteria for both water level data and discharge data that are used to assess and grade (i.e., A, B, C, E [estimated], and U [unknown]) the overall quality of hydrometric data:

- o instrumentation;
- o field procedures; and
- o data calculation and assessment.

The list provided below details the methods that were used in the study, with the aim to achieve high quality data based on the standards in each of the three criteria.

### 2.8.1 Instrumentation

Most instrumentation used and calibration/verification procedures comply with the highest quality data collection outlined in the RISC manual (i.e., Grade A). High accuracy recording data loggers and pressure transducers were used when possible for recording and determining of continuous water level at the hydrometric stations. Pressure transducers meeting RISC Grade C were used where flow conditions were more conducive to a smaller set ups than standpipes, due to low depth and unstable channel banks.

### 2.8.2 Field Procedures

The field procedures are designed to follow the highest standards outlined by RISC (Grade A). These include the use of a minimum of three benchmarks at each station, more than two level checks per year, 20 or more verticals (each accounting for <10% of the total discharge) in manual stream flow measurements, and five or more manual flow measurements per year.

Due to the narrow channel width at the some gauging locations, the number of vertical observations and percentage of flow in each panel of the flow measurements resulted in grade C data for this criterion.

### 2.8.3 Data Calculation and Assessment

Data calculations meet the high/mid-range of standards. Results are compared to other stations and years, and are reviewed for anomalies and deficiencies (Grade A). Discharge rating accuracy varies across the hydrometric monitoring network (between Grade A and B). Due to the unstable nature of the channels, rating curves often shift and rating points that are <15% (Grade B) from established curves are considered valid, although many of the points are with 5% (Grade A). Limited data collected to date does not meet the minimum recommended number of points used to develop some of the rating curves. Standards suggest that a minimum six (RISC 2018) to 15 (ISO 2010) field measurements are required to develop a robust single-segment rating curve. Rating curves having two and three segments are recommended to have a minimum of 14 and 22 field measurements, respectively, to develop robust rating curves (RISC 2018).

Additionally, RISC (2018) states: “hydrometric data should be graded as E (i.e., Estimated) when stations are operated using RISC standards (i.e., water level or discharge data could be Grade A/RS, A, B, or C) but data were estimated due to instrument anomalies, shift correction, missing data, or rating curve extrapolation beyond maximum or minimum measured discharge levels.” Some of the data collected for the Project as described above falls in this category and thus should be considered Grade E for discrete periods at each station (e.g. for discharge calculated from rating curves extrapolated beyond measured values).

### 3. RESULTS

The following sections present the results from the manual discharge measurements, rating curves, and discharge hydrographs for the 2020 stations. Station information sheets are provided in Appendix A, daily discharge measurements are provided in Appendix B, rating curves are presented in Appendix C, historical discharge tables are presented in Appendix D and complete historical hydrologic indices tables are presented in Appendix E.

#### 3.1 Discharge Measurements

Table 3.1-1 presents a summary of the discharge measurements that were made in 2020. Twenty manual discharge measurements were conducted between June and October 2020.

Table 3.1-1: Summary of 2020 Discharge Measurements

Station	Date	Stage (m)	Discharge (m <sup>3</sup> /s)	Difference from Curve <sup>1</sup> (%)	Method	Instrument <sup>2</sup>
JTS-H1	14-Jun-20	99.031	0.067	-8.53	Velocity-Area	Hach FH950
	15-Jun-20	99.043	N/A <sup>3</sup>	N/A <sup>3</sup>	Velocity-Area	Hach FH950

Station	Date	Stage (m)	Discharge (m <sup>3</sup> /s)	Difference from Curve <sup>1</sup> (%)	Method	Instrument <sup>2</sup>
P12 (cont'd)	24-Sep-20	N/A <sup>3</sup>	6.16 x 10 <sup>-4</sup>	N/A <sup>5</sup>	Volumetric	Graduated Cylinder/Stopwatch
	17-Oct-20	N/A <sup>3</sup>	4.52 x 10 <sup>-4</sup>	N/A <sup>5</sup>	Volumetric	Graduated Cylinder/Stopwatch

Notes:

<sup>1</sup> Difference from curve indicates how far the rating point (discharge measurement) was above or below the established rating curve.

<sup>2</sup> <http://www.hach.com/fh950-portable-velocity-meter-with-20-cable/product?id=10379735623>.

<sup>3</sup> N/A Stage measurement not conducted due to snowpack/ice affecting measurement, benchmarks removed or discharge measurement location only.

<sup>4</sup> Discharge measurements not taken due to localized settling that covered the outflow of the discharge culvert.

<sup>5</sup> Rating curve not developed or point not included due to no/or unreliable stage measurement.

### 3.2 Stage-Discharge Rating Curves

The relationships between stage and discharge were established for the three monitoring stations with available data. The 2020 stage-discharge measurements were compared to the existing rating curves to determine if the relationships were still valid. Where geomorphic changes to the channel occurred and rating points did not plot along the existing rating curve, a new curve was developed. Between six and thirteen rating points from the 2016 through 2020 monitoring programs were used to develop each curve. The rating equations are summarized in Table 3.2-1 and 2020 rating curves along with previous 2016 through 2019 curves are presented in Appendix C. Included in the tables are the number of stage-discharge field measurements used to construct the rating equations, the Root Mean Square Error and the years of measurements included in the rating equation.

Table 3.2-1: Stage-Discharge Rating Equations

Station	Rating Equation <sup>1</sup>	Number of Rating Points Used in Curve Development	RMS Error (Shift RMS)	Rating Period
JTS-H1	$Q = 4.015(h - 98.848)^{2.354}$	13	10.9	2016 - 2020
JTN-H1	$Q = 1.698(h - 99.494)^{1.947}$	13	7.1 (0.2)	2016 - 2020
P10-A	$Q = 1.339(h - 98.877)^{2.006}$	6	9.1	2019-2020

Notes:

<sup>1</sup> Equation  $Q = C(h - a)^b$  :  $Q$  is the discharge (m<sup>3</sup>/s),  $C$  and  $b$  are dimensionless coefficients,  $h$  is the stage (m), and  $a$  is the stage at zero flow (m).

### 3.3 Discharge Hydrographs

Daily discharge hydrographs were generated for the operational periods using the corrected stage records and rating curves for each station. Discharge hydrographs are presented in Figures 3.3-1 through 3.3-3, and include daily precipitation and temperature data collected at the Johnny Mountain meteorological station (UTM 371,942 E; 6,278,283 N; Zone 9V; NAD 83). The daily discharge tables for the hydrographs are presented in Appendix B and historical discharge tables are presented in Appendix D.

Local meteorological data is used to illustrate the relationship between stream flows and the weather, a detailed analysis of the meteorological data is provided in a separate memorandum (RTEC 2020b).

**Figure 3.3-1: 2020 Discharge Hydrograph for Station JTS-H1**

**Figure 3.3-2: 2020 Discharge Hydrograph for Station JTN-H1**

**Figure 3.3-3: 2020 Discharge Hydrograph for Station P10-A**

Annual hydrographs for the two automated hydrometric stations monitoring the TSF show a nival (snowmelt dominated) streamflow regime. The hydrographs are characterized by elevated streamflow during the spring freshet, when snow is melting, followed by a general decline in flow rate through the summer with periods of high flow resulting from precipitation events. Substantial peak events occurred in August as well as in the early fall, while a relatively warm and dry period in September saw a major decrease in stream flows (RTEC 2020b).

The groundwater discharge hydrograph for P10-A illustrates a general steady decline throughout the period of operation with less acute and significant reactions to precipitation events, when compared to JTS-H1 and JTN-H1. In comparison to the other stations, P10-A has a more prolonged response, with streamflows declining over the course a few days after a major precipitation event.

### 3.3.1 Discharge Estimates

Gaps in the flow data caused by station deactivation, malfunctioning pressure transducers, water levels dropping below the sensor elevation, or unreliable data caused by snow and ice buildup, were filled with modelled or estimated data using one, or a combination, of several methods. Regression models (Maidment 1992) were used to fill data gaps during the open water season (April - November). Logarithmic decay curves (Hersch 2009) were used during winter low flow periods to interpolate between discrete manual measurements made while hydrometric stations were not active. Concurrent periods of record from each station were used to determine the regression equation which was then applied to the data from the reference station to model daily discharge for the station with the missing data (Table 3.3-1).

Table 3.3-1: 2020 Regression Analysis Summary for Hydrograph Estimation

Hydrometric Station (Reference Station)	Concurrent Period <sup>a</sup>	Regression Equation	R <sup>2</sup>	Estimated Periods
JTS-H1 (WSC 08CG001)	July 10 - Sep 4	$Y = 0.0036e^{0.0019X}$	0.69	Jan 1 - Jun 15, Oct 17 - Nov 16
JTN-H1 (WSC08CG001)	July 10 - Aug 15	$Y = 8 \cdot 10^{-9} \cdot X^2 - 6 \cdot 10^{-7} X + 0.0016$	0.63	Jan 1 - Jun 15
JTN-H1 (JTS-H1)	July 11 - Aug 27	$Y = 2.015X^2 + 0.091X + 0.0024$	0.92	Jun 16 - Jul 9, Sep 5 - Oct 17

Note:

<sup>a</sup> Concurrent period represent the complete date range used in the analysis. In some cases there were data gaps (estimated periods) within the concurrent period used.

Daily discharge values were estimated for the missing periods of data at JTN-H1 and JTS-H1 in 2020. When discharge estimates were required, data was modelled by means of regression (correlation) analysis. Station JTN-H1 was paired with nearby station JTS-H1 for those periods of the year when station JTS-H1 was active but JTN-H1 was not. Stations were paired with the Water Survey of Canada (WSC) station 08CG001 for correlation during periods when both stations were not operational.

### 3.4 Hydrologic Indices

#### 3.4.1 Mean Annual Discharge

Mean annual discharge (MAD) for 2020 is presented in Table 3.4-1. In 2020, MAD ranged from 0.007 m<sup>3</sup>/s at JTN-H1 to 0.020 m<sup>3</sup>/s at JTS-H1. As a complete annual data set for station P10-A is not available, nor can it be accurately modelled based on other local stations, no MAD is presented and the observed daily averages are used for comparison between the stations instead. Observed daily average discharges for the periods of operation of the three stations range from 0.010 m<sup>3</sup>/s at P10-A to 0.045 m<sup>3</sup>/s at JTS-H1.

Table 3.4-1: 2020 Mean Annual Discharge

Station	MAD (m <sup>3</sup> /s)	Observed Average (m <sup>3</sup> /s)
JTS-H1	0.020	0.045
JTN-H1	0.007	0.013
P10-A <sup>1</sup>	N/A	0.010

<sup>1</sup> A complete annual data series is not available for P10-A, value is based on the station's period of operation from June 14<sup>th</sup> through October 17<sup>th</sup>, 2020.

#### 3.4.2 Annual Peak Flows

Annual daily peak flows are presented in Table 3.4-2. High flows were driven largely by snowmelt and heavy precipitation over the Project area in what was a wetter than average year (RTEC 2020b). In 2020, annual daily peak flows were the result of snowmelt in late June and ranged from 0.017 m<sup>3</sup>/s at P10-A to 0.190 m<sup>3</sup>/s at JTS-H1. Both JTN-H1 and JTS-H1 experienced peak flows well above historical maximums, a result of the wetter than average year.

Table 3.4-2: 2020 and Historic Daily Peak Flow

Station Name	Daily Peak Flow (m <sup>3</sup> /s)				
	Observed 2016 to 2019 <sup>1</sup>			2020	Date
	Min	Mean	Max		
JTS-H1	0.004	0.050	0.155	0.190	20-Jun-20
JTN-H1	0.003	0.023	0.047	0.092	20-Jun-20
P10-A	0.006	0.012	0.018	0.017 <sup>2</sup>	20-Jun-20

<sup>1</sup> Complete annual data series are not available for historic data, values are based on the stations period of operation during the open water season.

<sup>2</sup> A complete annual data series is not available for P10-A, values are based on the station's period of operation from June 14<sup>th</sup> through October 17<sup>th</sup>, 2020.

#### 3.4.3 7-Day Low Flow

Summer low-flows (June to September) and annual low flows were calculated using the minimum 7-day-average of daily flows. The 7-day summer and annual low flows are presented in Table 3.4-3 with summer lows being compared to historic low flows during the open water season in Table 3.4-4. The summer low flows at each station occurred in late September and ranged from 0.003 m<sup>3</sup>/s at JTN-H1 to 0.006 m<sup>3</sup>/s at P10-A. In contrast to observed daily flow averages and peak flows, P10-A has the highest low flows rather than JTS-H1. This reversal is consistent with historic trends and is likely a result of P10-A monitoring

groundwater discharge, which is less responsive to snowmelt and precipitation but maintains more stable flows throughout the year. Subsequently, while flows at JTN-H1 and JTS-H1 decreased significantly in September due to reduced precipitation inputs and warmer weather, groundwater flows decreased to a minimal degree during that same period. Annual low flows occurred in early April when precipitation is stored in the snowpack and streamflows are dependent on available groundwater. The April low flows were determined based on the modelling of data using regression analysis in correlation with the WSC station 08CG001 on the Iskut River (Environment Canada 2020). Annual daily low flows ranged from 0.002 m<sup>3</sup>/s at JTN-H1 to 0.004 m<sup>3</sup>/s at JTS-H1. Annual daily low flows are not available for P10-A in 2020 as the station was not operational for the entirety of the year and as a groundwater discharge monitoring location, is not suitable for modelling off of nearby stream data.

Table 3.4-3: 2020 7-Day Low Flows

Station	7-Day Summer Low Flow (m <sup>3</sup> /s)	Date	7-Day Annual Low Flow (m <sup>3</sup> /s)	Date
JTS-H1	0.005	21-Sep-20	0.004	8-Apr-20
JTN-H1	0.003	21-Sep-20	0.002	8-Apr-20
P10-A <sup>1</sup>	0.006	17-Sep-20	N/A	N/A

<sup>1</sup> A complete annual data series is not available for P10-A, values are based on the station's period of operation from June 14<sup>th</sup> through October 17<sup>th</sup>, 2020.

Table 3.4-4: 2020 and Observed Historic Low Flow Comparison

Station Name	Daily Low Flow (m <sup>3</sup> /s)			7-Day Summer Low Flow (m <sup>3</sup> /s)	Date
	Observed 2016 to 2019 <sup>1</sup>				
	Min	Mean	Max		
JTS-H1	0.001	0.002	0.004	0.005	21-Sep-20
JTN-H1	0.001	0.002	0.003	0.003	21-Sep-20
P10-A	0.003	0.004	0.005	0.006	17-Sep-20

<sup>1</sup> Complete annual data series are not available for historic data, values are based on the stations period of operation during the open water season and are not averaged over a 7-day period.

### 3.5 Summary

The surface water hydrology monitoring program was initiated in 2016 (RTEC 2016) and continued through 2017 (RTEC 2017), 2018 (RTEC 2019), 2019 (RTEC 2020) and 2020. In 2020, the hydrologic response generally exhibited was that of snow-melt dominated flow regimes. Relative to historic data, the 2020 results indicate that the project area experienced a cooler than average summer with above average precipitation (RTEC 2020b). The prominence and correlation of the precipitation with daily stream flow data varied between TSF monitoring stations and the groundwater discharge location, with TSF stations showing a greater response to precipitation events.

Mean annual discharges were 0.020 m<sup>3</sup>/s at JTS-H1 and 0.007 m<sup>3</sup>/s at JTN-H1, while P10-A had an observed mean discharge of 0.010 m<sup>3</sup>/s during its operational period. All stations experienced higher than average peak flows, with TSF monitoring stations experiencing discharges significantly higher than previous historical maximums. Likewise, summer low flows were near or greater than historical maximums, occurring in late September during a warm dry period

## APPENDIX A      STATION INFORMATION SHEETS

## Appendix A.1: Station Information Sheet for Hydrometric Station JTS-H1

Site ID:	JTS-H1	Drainage Area (km <sup>2</sup> ):	0	
Site Location:	Tailings Pond Seepage Collection			
UTM:	NAD 83, Zone 9 V	E 372,609	N 6,278,081	
<b>Benchmarks</b>	<b>Elevation</b>	<b>Description</b>		
BM 1	100.000	Bolt in bedrock ~25 m north (upstream) of station		
BM 2	100.240	Bolt in bedrock ~25 m north (upstream) of station		
BM 3	99.603	Bolt in bedrock used to secure data logger box		
Transducer:	PS98i	Data Logger:	GDL	
Operating Period: 2016-2020				
2016	Sep 24 - Oct 24			
2017	Apr 28 - Jun 22			
2018	Jun 9 - Oct 21			
2019	Jun 27 - Oct 31			
2020	Jun 14 - Oct 17			
General Comments:				
<ul style="list-style-type: none"> <li>Station located in pool ~100 m southwest of the tailing pond where a series of collection ditches converge into a single channel.</li> <li>Discharge measurements are taken at the outflow of the pool.</li> </ul>				

### General Site Information

Figure 1. Sketch of JTS-H1

Plan View of Site

### Site Map

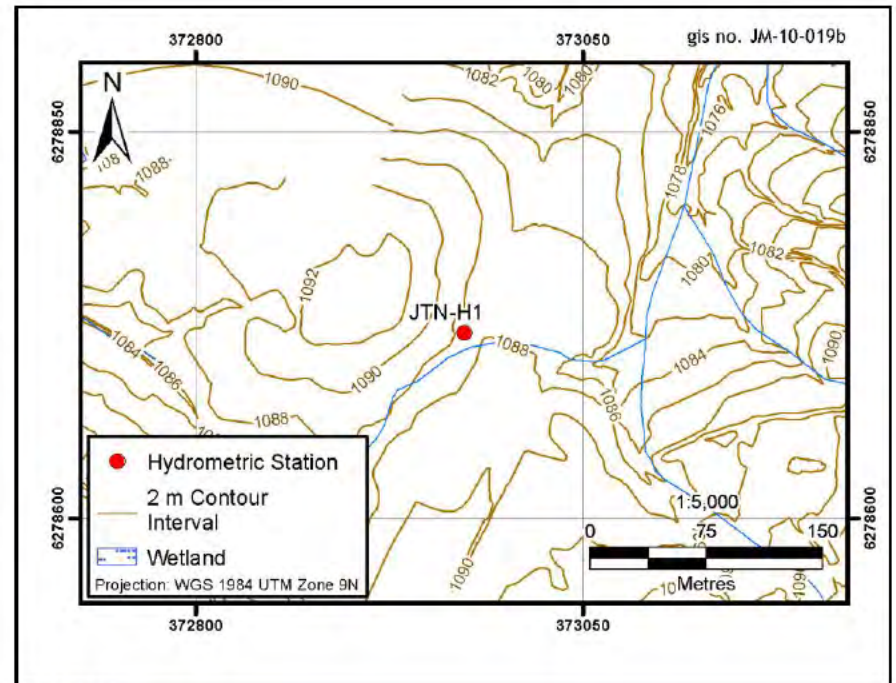

Station JTS-H1. View is looking upstream (Northeast).

Site Photo

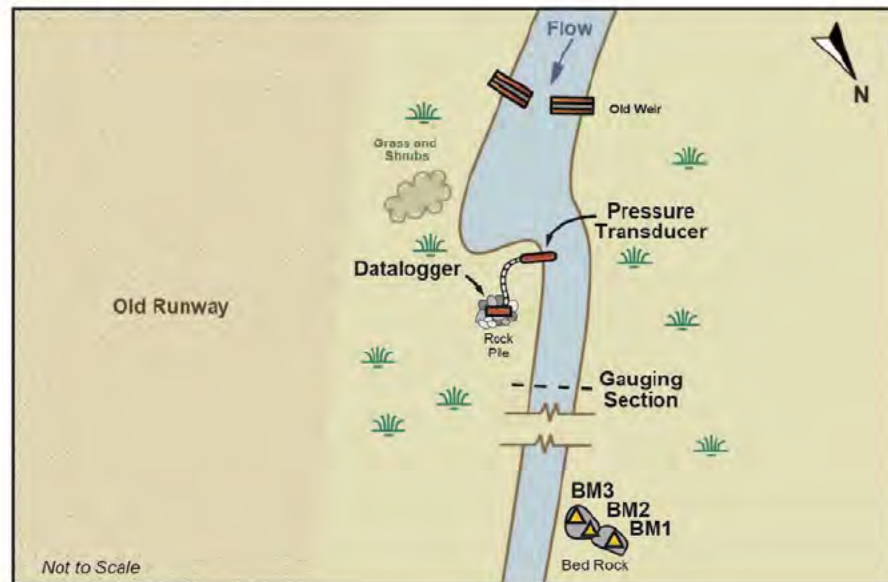

## Appendix A.2: Station Information Sheet for Hydrometric Station JTN-H1

Site ID:	JTN-H1	Drainage Area (km <sup>2</sup> ):	0
Site Location:	Tailings Pond Spillway		
UTM:	NAD 83, Zone 9 V	E 372,973	N 6,278,720
<b>Benchmarks</b>	<b>Elevation</b>	<b>Description</b>	
BM 1	100.000	Bolt in bedrock ~80 m north (downstream) of station	
BM 2	100.063	Bolt in bedrock ~80 m north (downstream) of station	
BM 3	100.011	Bolt in bedrock ~80 m north (downstream) of station	
Transducer:	PS98i	Data Logger:	GDL
Operating Period: 2016-2020			
2016	Sep 24 - Oct 24		
2017	Jul 8 - Oct 24		
2018	Jun 10 - Oct 21		
2019	Jun 27 - Oct 31		
2020	Jul 9 - Sep 24		
General Comments:			
<ul style="list-style-type: none"> <li>Located approximately 230 m northeast of the tailings pond within the main spillway channel.</li> </ul>			

### General Site Information

Figure 2. Sketch of JTN-H1

Plan View of Site

### Site Map

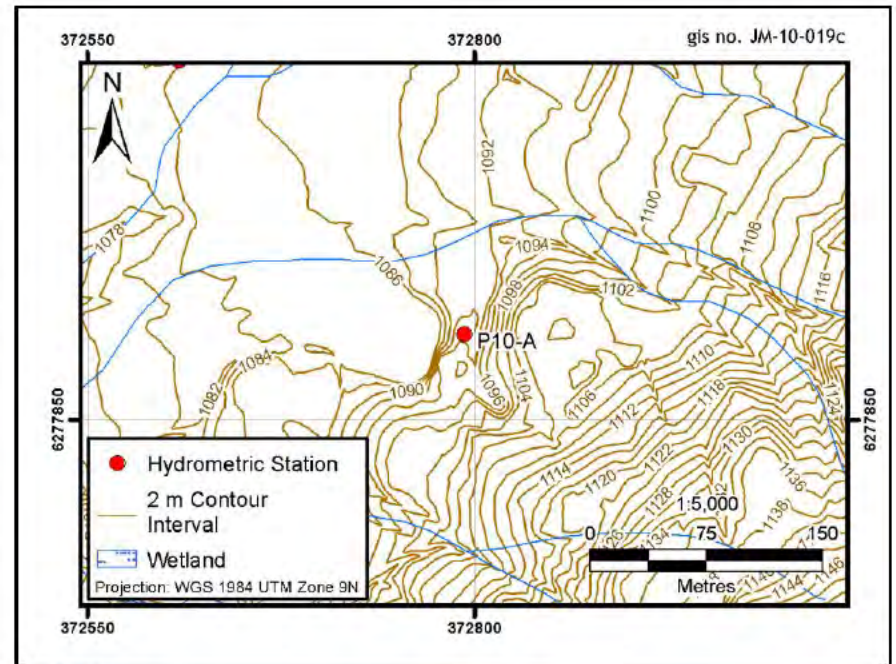

Station JTN-H1. View is looking upstream (Southwest).

Site Photo

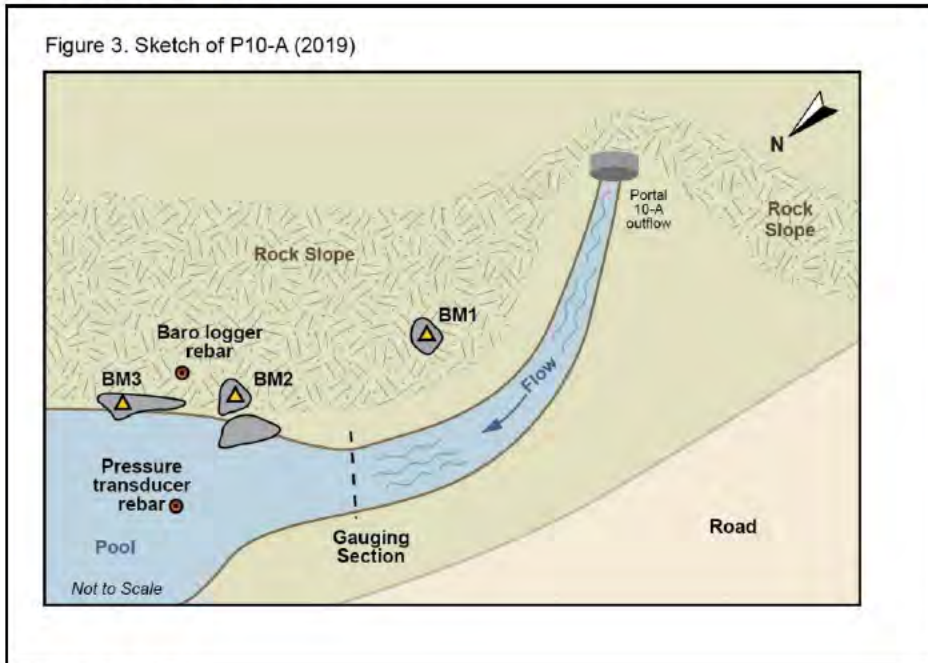

### Appendix A.3: Station Information Sheet for Hydrometric Station P10-A

Site ID:	P10-A	Drainage Area (km <sup>2</sup> ):	N/A
Site Location:	Level 10 Portal Outflow		
UTM:	NAD 83, Zone 9 V	E 372,802	N 6,277,921
<b>Benchmarks</b>	<b>Elevation</b>	<b>Description</b>	
BM 1	100.000	Bolt in Bedrock ~15 m upstream of station	
BM 2	99.221	Bolt in bedrock ~1 m upstream of station	
BM 3	99.101	Bolt in bedrock beside station on south bank	
Transducer:	Micro-Diver	Baro Logger:	Micro-Diver
Operating Period: 2016-20120			
2017	Jun 9 - Oct 24		
2018	Jun 9 - Aug 29		
2019	Jun 27 - Oct 31		
2020	Jun 14 - Oct 17		
General Comments:			
<ul style="list-style-type: none"> <li>Station was relocated in 2019 due to remediation work in 2018. Station is located approximately 40 m downstream of level 10 portal discharge culvert.</li> <li>Station is used to monitor groundwater outflow from the portal.</li> </ul>			

#### General Site Information

#### Site Map

#### Plan View of Site

Station P10-A. View is looking downstream (North).

#### Site Photo

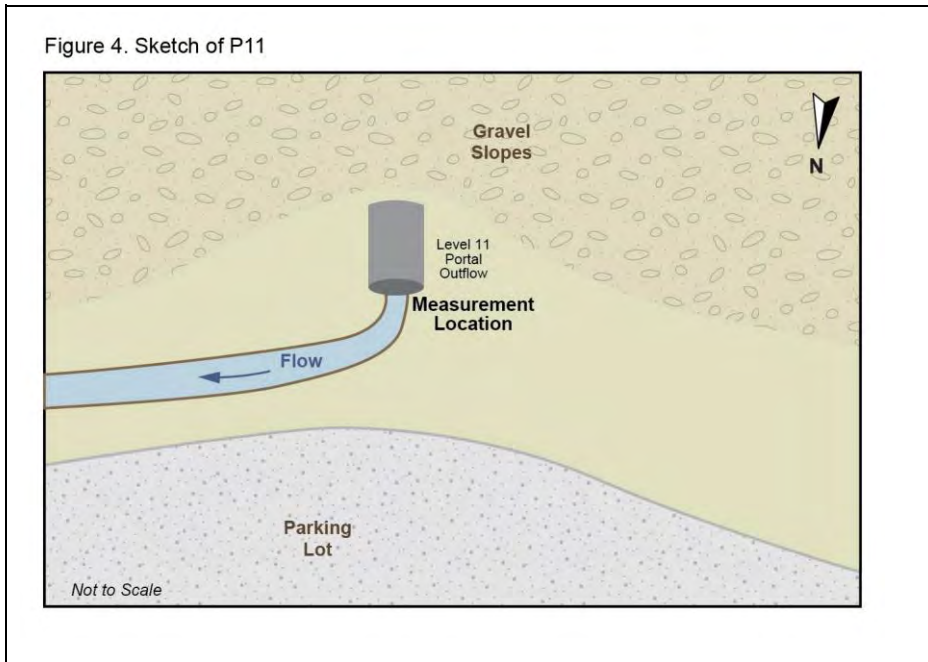

Appendix A.4: Station Information Sheet for Hydrometric Station P11

Site ID:	P11	Drainage Area (km <sup>2</sup> ):	N/A
Site Location:	Level 11 Portal Outflow		
UTM:	NAD 83, Zone 9 V	E 372,955	N 6,277,725
Benchmarks	Elevation	Description	
BM 1	N/A	N/A	
BM 2	N/A	N/A	
BM 3	N/A	N/A	
Transducer:	N/A	Data Logger:	N/A
Operating Period: 2017-2020			
2017-2020	Manual discharge measurements only		
General Comments:			
<ul style="list-style-type: none"> <li>Level 11 portal discharge can be accessed by the roads above the old mill building.</li> <li>No benchmarks or station is installed, volumetric discharge measurements are used to monitor the groundwater outflow from the portal.</li> </ul>			

General Site Information

Site Map

Plan View of Site

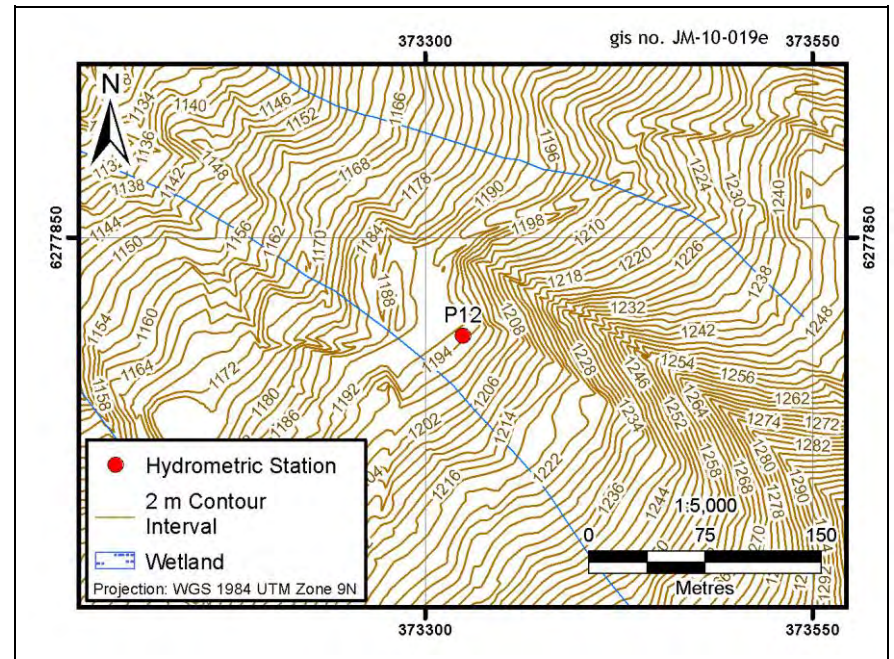

Station P11. View is looking at outflow culvert (South).

Site Photo

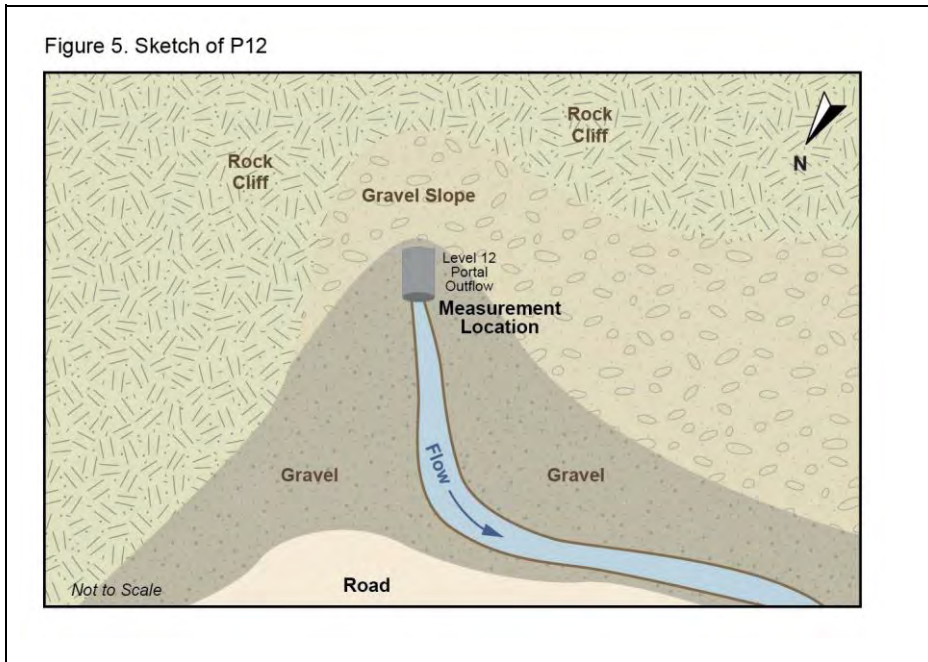

Appendix A.5: Station Information Sheet for Hydrometric Station P12

Site ID:	P12	Drainage Area (km <sup>2</sup> ):	N/A
Site Location:	Level 12 Portal Outflow		
UTM:	NAD 83, Zone 9 V	E 373,324	N 6,277,787
Benchmarks	Elevation	Description	
BM 1	N/A	N/A	
BM 2	N/A	N/A	
BM 3	N/A	N/A	
Transducer:	N/A	Data Logger:	N/A
Operating Period: 2017-2020			
2017-2020	Manual discharge measurements only		
General Comments:			
<ul style="list-style-type: none"> <li>Level 12 portal discharge can be accessed by the roads above the old mill building.</li> <li>No benchmarks or station is installed, volumetric discharge measurements are used to monitor the groundwater outflow from the portal.</li> </ul>			

General Site Information

Site Map

Plan View of Site

Station P12. View is looking at the culvert outflow (East).

Site Photo

## APPENDIX B      DAILY DISCHARGE TABLES

**Elizabeth Miller, M.Sc., R.P.Bio.**  
**Program Manager/Environmental Supervisor**

Dear Ms. Miller:

**Johnny Mountain Mine - Tailings Storage Facility**  
**2020 Dam Safety Inspection**

We are pleased to submit our 2020 Dam Safety Inspection (DSI) report for the Johnny Mountain Mine (JMM) Tailings Storage Facility (TSF).

Yours truly,

**KLOHN CRIPPEN BERGER LTD.**

David Willms, P.Eng.  
Project Manager

## Johnny Mountain Mine - Tailings Storage Facility

### *2020 Dam Safety Inspection*

## CLARIFICATIONS

This report is an instrument of service of Klohn Crippen Berger (KCB). The report has been prepared for the exclusive use of SnipGold and the applicable regulatory authorities for the specific application to the Johnny Mountain TSF, and it may not be relied upon by any other party without KCB's written consent.

KCB has prepared this report in a manner consistent with the level of care, skill and diligence ordinarily provided by members of the same profession for projects of a similar nature at the time and place the services were rendered. KCB makes no warranty, express or implied.

Use of or reliance upon this instrument of service by the Client is subject to the following conditions:

1. The report is to be read in full, with sections or parts of the report relied upon in the context of the whole report.
2. The Executive Summary is a selection of key elements of the report. It does not include details needed for the proper application of the findings and recommendations in the report.
3. The observations, findings and conclusions in this report are based on observed factual data and conditions that existed at the time of the work and should not be relied upon to precisely represent conditions at any other time.
4. The report is based on information provided to KCB by the Client or by other parties on behalf of the client (Client-supplied information). KCB has not verified the correctness or accuracy of such information and makes no representations regarding its correctness or accuracy. KCB shall not be responsible to the Client for the consequences of any error or omission contained in Client-supplied information.
5. KCB should be consulted regarding the interpretation or application of the findings and recommendations in the report.

## EXECUTIVE SUMMARY

### Summary of Facility Description

The TSF area (Figure 2) is approximately 11.5 ha, with a 10 ha pond and compacted glacial till dykes on three sides and a shorter dyke tying into high ground on the north side. The dykes were constructed in 1988 initially to El. 1076.0 m old datum (OD)<sup>1</sup> and raised to a final minimum level of El. 1079 m OD in 1989 (with some crest levels up to El. 1080.2 m OD). The compacted till dykes were built on natural ground that formed an impoundment around a mountain lake or “tarn”. Figure 3 shows the site topography and bathymetry from 2017 surveys, and Figure 4 shows five cross sections showing the 2017 downstream embankment slope. A review of the design and 'as-built' cross-sections from field construction reports indicated that the dams are between 3 m and 9.9 m high (verified by 2017 LIDAR survey), with a nominal 5 m crest width (ranges from 4.7 m to 11 m). Slopes are nominally 2.5H:1V downstream and 1.5H:1V upstream but downstream slopes are locally as steep as 1.9H:1V. The stability of this slope has been reviewed by the EoR and is considered safe based on the planned closure activities and current surveillance program.

In this report and inspection summaries, the four arms are described as Northwest Dam, Northeast Dam, Southeast Dam and Southwest Dam as shown on Figure 2.

### Summary of Key Hazards

The key hazards and potential risks are summarized in Section 8.4. The following failure modes were considered, have been determined to be low risk, and are appropriately managed by SnipGold’s operating practices.

1. *Dam foundation failure leading to a dam failure and release of tailings, under seismic loading leading to undrained strength failure.*
2. *Dam embankment failure leading to a release of tailings under static stability or seismic loading.*
3. *Failure of the blanket underdrain system raising the phreatic surface in the dam.*
4. *Piping of fines through the granular underdrain could lead to dam failure.*
5. *Failure of the spillway leading to dam overtopping or breach.*
6. *Failure of upstream diversions, causing additional storm runoff into the TSF.*
7. *Internal erosion of dam fill initiated by animal burrowing in the dam.*

### Consequence Classification

The current consequence classification is Significant under the *Canadian Dam Association Dam Safety Guidelines* (CDA 2013) and the CDA Technical Bulletin for Mining Dams (CDA 2014). Dam consequence classifications can be Low, Significant, High, Very High and Extreme. This classification was confirmed by a dam breach study conducted in 2018 (KCB 2018c).

---

<sup>1</sup> Old Datum = OD.

New Datum = ND = old datum + 18.6 m.

## Summary of Significant Changes (Construction, Development Downstream etc.)

There were no significant changes to the TSF in 2020.

### Significant Changes in Instrumentation or Visual Monitoring Records

The weirs installed in 2015 appear to be functioning; however, the location of the weirs could be optimized to better intercept seepage at key locations. The weir locations will be reviewed as part of the final closure plan.

The general piezometric and flow levels are consistent with historic values or historic estimates. Three out of ten vibrating wire piezometers appear to be tracking pond level with up to 1.5 m annual fluctuation, five out of ten also appear to fluctuate seasonally but at 0.5 m to less than 1 m annual fluctuation, and two of the ten ceased functioning in 2019 or 2020 since the last dam safety inspection. The reason for the malfunction is unknown as the two piezometers (DH17-04A and DH17-05A) did not show any unusual readings before malfunctioning. The cause of the instrument failure should be reviewed with the instrument and datalogger supplier (RST Technical). As well, the metal riser for DH17-02 was found to have snapped off at the base likely due to high wind stress and should be replaced.

SnipGold carried out periodic inspections and read the piezometers that were installed in 2017.

### Significant Changes to Stability and / or Surface Water Control

There were no significant changes to stability or surface water control.

Minor tension cracks have developed on the upstream slope of the dam as a result of wave action and freeze-thaw effects against the upstream face, particularly in areas repaired in 2017. These are a maintenance issue and not currently a dam safety concern and will be addressed as part of closure work.

Downstream slopes have minor rilling, minor slumping, and minor local erosion but are generally in satisfactory condition. These shallow defects do not represent conditions that could rapidly impact the overall stability of the dam, provided that they are monitored and addressed over time. Without periodic maintenance, these shallow defects could regress and endanger the dam crest. These are currently a maintenance issue and not currently a dam safety concern and will be addressed as part of closure work.

### Summary of Review of OMS Manual

In 2018, a new Operations, Maintenance and Surveillance (OMS) manual was prepared for the TSF including maintenance and surveillance requirements (KCB 2018d). The next update to the OMS Manual should add Quantitative Performance Objectives for the vibrating wire piezometers to routine surveillance. Recommended alert levels for vibrating wire piezometers are included in this DSI.

### **Summary of Review of ERP**

The OMS Manual contains an Emergency Response Plan (ERP) for emergencies at the TSF and includes the site wide ERP for emergencies at the camp and for the exploration team. This ERP was last updated in 2018.

### **Scheduled Date for Next Dam Safety Review**

The next Dam Safety Review (DSR) is scheduled for 2021.

### **Summary of 2020 Recommendations**

Four recommendations and one MEM (now Ministry of Energy, Mines and Low Carbon Innovation - MEMLCI) order from previous years have not been closed out, and are to be closed out during closure construction. Section 10 includes updates of past recommendations. The MEMLCI order was addressed by a letter request to the MEMLCI for an exemption for an Independent Tailings Review Board (ITRB); KCB issued a letter to support this exemption. This letter is included in Appendix IV.

Three additional recommendations were made as part of this DSI: to investigate the cause of the malfunction of DH17-04A, and -05A (or their dataloggers), to repair the metal riser for DH17-02, and to remove two defunct culverts as part of closure activities. This last recommendations should be done as part of the overall closure activities and regrading work at the site. None of the circumstances contributing to the outstanding recommendations represent an immediate risk to the facility. All remaining recommendations are considered Priority 4, which is the lowest priority, or items that are considered housekeeping, or best practices. In KCB's opinion, the facility was functioning safely and as intended at the time of our inspection.

## 1 INTRODUCTION

This report presents our 2020 Dam Safety Inspection (DSI) carried out by Klohn Crippen Berger Ltd. (KCB) for the closed Johnny Mountain Tailings Storage Facility (TSF) owned by SnipGold Corporation – a Subsidiary of Seabridge Gold Inc. (SnipGold). This DSI has been prepared to meet the requirements of Section 10.5.3 of the Health, Safety and Reclamation Code for Mines in British Columbia - revised July 2017, (HSRC 2017) which includes the HSRC Guidance Document (HSRC 2016).

The TSF is located at the former Johnny Mountain Mine. The site is located approximately 100 km northwest of Stewart, BC (56°37'45''N and 131°04'20''W) at about elevation 1100 m above sea level, between the Craig and Iskut Rivers on an alpine plateau on the northwest flank of Johnny Mountain (see Figure 1<sup>2</sup> and Figure 1.1). The site is accessed by helicopter from McLymont Staging Area or Bell II and is connected to SnipGold's nearby Iskut Camp by a 4x4 road.

Mr. Neil K. Hemrajani Singh, P.Eng. of KCB is the Engineer of Record (EoR) for reporting to the Ministry of Energy, Mines and Low Carbon Innovation, British Columbia (MEMLCI). Mr. Singh of KCB and Ms. Elizabeth Miller of SnipGold conducted the 2020 site inspection with other representatives of SnipGold.

This DSI includes document review, interviews with site personnel, a site walkover inspection, review of site instrumentation data, and review of 2020 works.

A Dam Safety Review was conducted in 2016 and included discussion and summary of previous construction and site operations history (KCB 2017b). This 2020 DSI report focuses on the 2020 site conditions and contains a subset of information for historical context, from the DSR and previous DSIs.

---

## 2 BACKGROUND INFORMATION

### 2.1 Organization and Responsibilities

The mine is in Closure – Active Care as defined in by CDA (2013). There are ongoing plans and investigations to clean up the site. SnipGold’s site management team and key roles are as follows.

#### Chairman and Chief Executive Officer – Rudi Fronk

- Mr. Fronk has overall responsibility for the mine and TSF.

#### Mine Manager and Exploration Manager – Marcus Adam

- Although the mine is not operating, in practical terms Mr. Adam is the “Mine Manager” as defined for this closed facility under Section 21 of the Mines Act having responsibility for the mine as delegated by Mr. Fronk.
- Mr. Adam manages the site exploration program, and acts as site manager, which includes responsibility for the currently inactive tailings facility.

#### Environmental Coordinator and TSF Qualified Person – Elizabeth Miller, R.P.Bio., Vice President Environment and Social Responsibility (Seabridge Gold)

- TSF Qualified Person, as required by the HSRC, Section 10.4.2 with responsibility for developing and implementing the tailings and water management plans for the TSF, coordination of design, construction and overall management of the TSF, and succession plans for the EoR.

#### Site Environmental Manager and Alternate TSF Qualified Person – Kevin Hidber

- Field based alternate TSF Qualified Person.

#### Engineer of Record – Neil K. Hemrajani Singh, P. Eng.

- Has been EoR since October 1, 2016.
- Responsibilities include carrying out Dam Safety Inspections and preparing the reports for submission to regulators.

#### Alternate EoR - David Willms, P. Eng.

- Alternate EoR in the event that Mr. Singh is unavailable or incapacitated.

### 2.2 Regulatory

#### 2.2.1 Regulations

*Health, Safety and Reclamation Code for Mines in British Columbia (Ministry of Energy and Mines, Revised June 2017)*, Section 10 of the code regulates the reclamation and closure of tailings impoundments in British Columbia.

Section 4.2 of the *Health, Safety and Reclamation Code Guidance Document* (MEM 2016) provides a list of items that as a minimum should be provided in a dam safety inspection report.

*British Columbia Environmental Management Act (October 2003)*: This act provides regulations under which prescribed industries including the mining industry, may release waste to the environment.

*British Columbia Water Sustainability Act (February 2016)*: This act regulates licensing, diversion and use of water resources and replaces much of the previous BC Water Act.

### 2.2.2 Guidelines

*Canadian Dam Association Dam Safety Guidelines* (CDA 2013) cover principles that are applicable for all dams and should be understood and followed by dam owners, managers, operators and other interested parties. Additional specific guidelines and clarification for mining dams is given in *Technical Bulletin Application of Dam Safety Guidelines to Mining Dams* (CDA 2014). This Technical Bulletin includes the consideration of the various operating and closure stages of a tailings dam.

### 2.2.3 Permits

The following permits govern the operation and management of the former Johnny Mountain Mine:

1. Permit PR-7927 - Water Management Act, issued by the BC Ministry of Environment, Lands and Parks, July 14, 1999, amended June 2008, amended August 2, 2011, amended 23, 2011, amended February 22, 2018, amended May 31, 2018. The last amendment is under the Environmental Management Act (EMA) by the Ministry of Environment and Climate Change Strategy (MECCS).
2. Permit PE-8415 – Environmental Management Act, issued by the BC Ministry of Environment, and Climate Change Strategy, June 6, 1990, amended May 11, 2000, amended June 10, 2019.
3. M-178 – Mines Act R.S.B.C. 1996 c. 293, amended permit Approving Work System and Reclamation Program, October 13, 1999, amended July 7, 2004.

### 2.2.4 Water Quality Monitoring Requirements

Water quality monitoring requirements are outlined in the June 2019 amendment to Permit PE-8415. The results are reported annually in the PE-8415 Annual Report, which is reported separately by SnipGold.

### 2.2.5 Regulatory Inspections

MEMLCI conducts periodic geotechnical inspections of the site to determine if the site is in compliance with the Code and permit conditions. The most recent inspection was conducted by Dr. Paul Hughes, Geotechnical Inspector on July 13, 2017.

A Senior Geotechnical Inspector, Mr. Eamon Mauer, P.Eng. reviewed the Standard Operating Procedure (SOP) in May 2020 and provided comments, but not under a formal inspection.

## 2.3 Site Datum

The original design drawings and construction records used a local datum, and were presented in Imperial units. Work through the 2000s used the same Old Datum<sup>3</sup> but with maps and data in metric. The site survey including LiDAR conducted in 2017, has used a new datum, which is approximately “Old Datum” + 18.6 m. Unless otherwise stated, this new datum (ND) has been used for this report.

For consistency, we have converted all information to metric.

---

<sup>3</sup> In this report, values are presented as Old Datum (OD) if they were based on the original construction survey. New datum (ND) is used for recent survey and current elevations.

## 3 TAILINGS STORAGE FACILITY DESCRIPTION

### 3.1 Description

The TSF is located north of the 10-level portal on the west side of the former Johnny Mountain airstrip and comprises a wet cover tailings storage facility (TSF) with a closure spillway, seepage collection ditches and seepage ponds. The TSF area (Figure 2) is approximately 11.5 ha, with a 10-ha pond and compacted till dykes on three sides and a shorter dyke tying into high ground on the north side. The dykes were constructed in 1988 initially to El. 1076 m OD and raised to a final minimum level of El. 1079 m OD in 1989 with some crest levels up to El. 1080.2 m OD. The compacted till dykes were built on natural ground that formed an impoundment around a mountain lake or “tarn”.

Figure 3.1 provides a plan of the original layout. Figure 3.2 provides a typical design cross section from 1987, and Figure 3.3 shows an as-built cross section from 1989. Figure 3.4 shows a more current cross-section based on 2017 LiDAR and 2017 drilling results. Figure 3<sup>4</sup> shows the site topography and bathymetry from 2017 surveys, and Figure 4 shows five cross sections showing the downstream embankment slope based on 2017 LiDAR survey. A review of the design and 'as-built' cross-sections from field construction reports indicates that the dams are between 3 m and 9.9 m high (verified by 2017 LIDAR survey), with a nominal 5 m crest width (ranges from 4.7 m to 11 m). Slopes are nominally 2.5H:1V downstream and 1.5H:1V upstream but downstream slopes are locally as steep as 1.9H:1V.

The dams comprising the TSF were classified as Significant consequence dams as part of the 2016 DSR (KCB 2017b) under the CDA Dam Safety Guidelines (CDA 2013) and the CDA Technical Bulletin for Mining Dams (CDA 2014). Dam consequence classifications can be Low, Significant, High, Very High and Extreme. This classification was confirmed by a dam breach study conducted in 2018 (KCB 2018c). There have been no changes since 2018 that would substantively change the consequence classification.

For the purpose of this report and inspection summaries, the four dams are described as Northwest Dam, Northeast Dam, Southeast Dam and Southwest Dam as shown on Figure 2.

Note: Piezometer levels shown are the typical range of water levels.

## 3.2 TSF History

### Operations

Johnny Mountain Mine was operated from November 1988 until September 1990 and from September to December 1993 by Skyline Gold Corporation (later SnipGold).

### TSF Design and Construction

The TSF was designed and constructed under the direction of R.C. Dick, P.Eng., Geotechnical Consultant (Dick 1987a) with compacted till embankments built on dense basal till overlying bedrock. The dams were built to a maximum of El. 1080.2 m (old datum, Dick 1999).

Tailings were first deposited along the southwest dyke and later from the southwest corner with beach development pushing the decant pond to the east towards the spillway. Sluicing operations were conducted in 1990 to lower the tailings beach against the embankments. The tailings are currently flooded by approximately 0.5 m to 5 m depth of water. Islands of tailings observed in previous years have been regraded by SnipGold, such that the tailings now are underwater. A bathymetric survey conducted in 2017 (RTEC 2017d) indicates pockets in the tailings surface of 2 m to 4 m depth, and 5 m to 6 m depth in the northeast, closest to the spillway. The pond contains an estimated 124,000 m<sup>3</sup> of tailings (198,000 tonnes) (Closure Plan, Skyline 1999). Tailings density has been estimated to range from 1.45 t/m<sup>3</sup> to 1.77 t/m<sup>3</sup> and, averaging 1.6 t/m<sup>3</sup>. The estimated remaining storage capacity when last used (December 1993) based on the original design capacity was 70,000 m<sup>3</sup> (Skyline 1999). The estimates for storage available within the TSF have been updated based on 2017 bathymetric survey, and these have been used in the closure planning design for storage of PAG waste rock. The 2018 Closure Design report provides an estimate of 135,000 m<sup>3</sup> capacity with a 0.5 m water cover, or approximately 88,000 m<sup>3</sup> with 1 m water cover (KCB 2018a), after relocation of tailings above the specified cover depth to deeper parts.

The dykes were constructed in three stages, with Stage 1 to approximately El. 1074.4 m OD, Stage 2 to El. 1079.0 m OD, and Stage 3 to nominally El. 1080.2 m OD, between September 1987 and November 1988, including a winter construction season. Although the original design included a compacted till cut-off trench, the foundation preparation exposed firm till or bedrock and hence no cut-off was built.

A blanket drain was built downstream of the embankment centreline of nominally 700 mm thickness, of 8-inch minus granular fill, except for the SW corner where the drain thickness was increased to 2 m to cross an old creek bed. A small slump was noted on the east dyke in 1992 and this was repaired by constructing a 4.5 m wide downstream berm between the airstrip and the spillway. At the Northeast Dam, a section was overbuilt by 1 m in height and 5 m width extending 100 m east from the abutment to allow construction access by loaded scrapers. This overbuilt section is not compacted to design requirements but is outside the dam design section. A small slough was noted on the overbuilt (access ramp) section of the Northeast Dam in 2020.

## Spillway

A temporary spillway was built in the Northeast Dam to El. 1073.5 m OD in February 1988, replaced by a permanent spillway in November 1988 following a design by Dames & Moore which included a geotextile and coarse mine waste rock liner. The channel was formed by excavation in the till down to El. 1077.8 m OD across the dam crest, and a riprap cover of 0.45 m placed overtop the crest channel, then down the downstream slope to form a spillway chute. The chute was widened and side walls (riprap over glacial till) along the chute were enlarged in 1993. Figure 5<sup>5</sup> shows the current spillway configuration.

## 3.3 Climate

### 3.3.1 Climate

The 2017 TSF Closure Design report (KCB 2018a) includes an updated review of climate at the site, with a statistical correlation of data from the Stewart A climate station to the site data, including new data from the Johnny Mountain climate station installed in 2016.

The site is located between El. 1075 m (at the TSF) and 1225 m (at the Level 12 Portal) above sea level in the transition zone between the coastal and interior climatic zones. The site is subject to significant precipitation year-round and very heavy snowfall during the winter months. The Stewart A station is perhaps not a direct correlation due to lower elevation and proximity to the coast; however, it represents one of the better available historic data sets in the region.

Average annual precipitation, as well as wet and dry year annual precipitation values, were based on the monthly precipitation record at Stewart, and are shown in Table 3.1. The monthly distribution of rain and snow shown in Table 3.2, is based on Johnny Mountain data.

**Table 3.1 Johnny Mountain TSF Annual Precipitation for Average, Wet and Dry Years (KCB 2018a)**

Return Period	Annual Precipitation (mm)
1:200 Dry Year	1,213
1:100 Dry Year	1,308
1:50 Dry Year	1,411
1:20 Dry Year	1,559
1:10 Dry Year	1,687
1911-2015 Mean	2,089
1:10 Wet Year	2,492
1:20 Wet Year	2,619
1:50 Wet Year	2,768
1:100 Wet Year	2,870
1:200 Wet Year	2,966

*Based on correlation to Stewart precipitation record*

<sup>5</sup> Figures 1, 2, 3, 4 and 5 are at the end of the document.

**Table 3.2 Monthly Precipitation Distribution (KCB 2018a)**

	Month												Annual
	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	
Precipitation	12%	8%	8%	3%	4%	3%	4%	6%	11%	12%	11%	18%	100%
<i>Rainfall</i>	0%	1%	0%	0%	2%	3%	4%	6%	10%	6%	0%	1%	34%
<i>Snowfall</i>	12%	7%	7%	3%	2%	0%	0%	0%	1%	7%	11%	17%	66%

Evaporation data from nearby stations, Juneau Airport, Alaska and Topley Landing, BC, were adjusted for elevation and latitude to derive a lake evaporation estimate for the Project site. The data from these two sites was comparable to 4 years of evaporation data from the nearby Teigan Lake (KSM station, similar elevation to Johnny Mountain at approximately El. 1085 m). The resulting average annual evaporation at Johnny Mountain TSF is therefore estimated as 258 mm.

A Mine Environment Neutral Drainage (MEND 2004) program report on Metal Leaching / Acid Rock Drainage (ML/ARD) reports the site receives 2.0 m to 2.6 m of precipitation per year and estimated sublimation and evaporation is 250 mm per year but they also report up to 30 m of snowfall may occur annually. The high snowfall measurement may have been influenced by local snow drifting, as the water equivalent of 30 m snowfall is more than the typical maximum annual precipitation of 2.6 m. Most of the precipitation arrives as snow, and melts in May and June, with traces remaining on site until July.

### 2020 Weather Data

Site weather data from October 2019 to October 2020 is shown in Figure 3.5 and Figure 3.6. The year, overall, was warmer and wetter than average.

In lieu of a sufficiently long dataset to make comparisons to previous years, precipitation data at a nearby weather station at Eskay Creek (NHC 2018) is also shown on Figure 3.5 for comparison. In the review period, November, February, June, July, and August had more precipitation than the average, March was drier than average, and the remaining months were similar to the average. Total precipitation recorded at Eskay Creek was 2070 mm, which is higher than the 2013 to 2020 mean of 1572 mm. The site precipitation data generally agrees with the Eskay Creek station for months where data is available from both stations.

The 2019/2020 mean monthly minimum and maximum temperatures were lower than average in January and higher than average in November, December, February, May, and September.

**Figure 3.5 2019/2020 Precipitation Data**

**Figure 3.6 2019/2020 Temperature Data**

## 4 2019 SITE ACTIVITIES

### 4.1 Construction

No construction activities took place in 2020 due to COVID-19 restrictions on camp capacity.

### 4.2 Site Inspections

Mr. Kevin Hidber of SnipGold conducted site inspections on June 17, 2020 and August 1, 2020. Ms. Elizabeth Miller of SnipGold also completed an inspection form during the DSI site visit on August 20, 2020. Site inspection checklists are included in Appendix III. The site was still snow covered but partially exposed in June, but clear for both of the August site visits.

Observations include minor sloughing and erosion in some areas on the downstream face, some minor tension cracks from wave and freeze/thaw action on the upstream crest, some local seepage and wet areas near the dam toe, and a slump or slough of about 3 m width, 2 m length, 0.5 m depth on the outer edge of the Northeast ramp. Spillway flow was negligible in June but flow was noted in August with a maximum depth of 80 mm over the spillway inlet invert in August.

The Engineer of Record, Mr. Neil K. Hemrajani Singh, P.Eng. conducted the 2019 Dam Safety Inspection site visit. Mr. Singh visited the site on August 20, 2020 accompanied by the SnipGold TSF Qualified Person, Ms. Elizabeth Miller; and SnipGold representatives, Ms. Jessy Chaplin, and Mr. Lionel Sequeira. The site visit letter is included in Appendix I. The site visit letter summarizes the trip, interviews, photographs, and findings. Photos referenced in this DSI are in Appendix I of the site visit letter unless otherwise noted.

The following points are noted:

- The crest is in good condition (Photos I-6, I-7, I-12, I-14, I-17, and I-23). There is minor localized rutting and undulations, with minor evidence of ponding at low spots.
- The upstream slope is in good condition (Photos I-6, I-9 I-15, I-16, I-20, and I-22). There are minor tension cracks along some areas of the upstream crest where repairs were completed in 2017. This is likely due to wave erosion and freeze-thaw action against the steep upstream slopes. This cracking is similar to previous years, not an immediate concern and will be addressed as part of closure work.
- Downstream slopes have minor rilling, minor slumping, and local minor erosion but are generally in good condition (Photos I-3, I-4, I-8, I-10, I-13, I-14, I-18, I-21, I-24, and I-25). Vegetation coverage is sparse, with few small shrubs growing on the downstream slope.
- Previous areas of marmot burrowing on the downstream face of the Southwest Dam near DH17-04 were examined. There was no new evidence of marmot activity on the dam. Marmots were seen on the nearby landfill to the north.
- Seepage was observed on the northwest and northeast dam slopes, and at the toe of all the dams (Photos I-5, I-8, I-19, I-25, I-26, I-27, and I-29). The seepage is well contained in drainage ditches or seepage collection ponds at the dam toes. Four v-notch weirs are used to monitor flows, but will need to be relocated for better efficacy (Photos I-37, I-38, I-39 and I-40).

- There was no construction activity at the TSF in 2020. Plans for waste rock disposal in the TSF have been deferred to 2021. The spillway is in good condition (Photos I-11, I-28, I-33, and I-34). The pond level was measured as 0.335 m on the staff gauge. Maximum flow depth at the spillway invert was 80 mm at the time of inspection (August 20, 2020) giving an estimated pond level of 1096.77 m.
- No reclamation activities at the landfill at the northwest corner of the TSF have been undertaken since the last DSI, in 2019 (Photos I-30, and I-31). The engineered landfill contains metal and construction debris and is separated from the TSF pond by an access road. There was subsidence of the fill cover over the uneven landfill materials leading to sinkholes and openings on the landfill surface. These localized differential settlement points are to be expected due to the very uneven surface and openings in the construction debris.
- There is a culvert through the access road between the landfill and the TSF; however, this culvert is above the low point on the road and thus has no effect. The culvert is not needed, but there is also no benefit to removing it at this time – it can be removed when final closure activities are conducted.
- A second 450 mm diameter corrugated metal pipe (CMP) is located in the Southwest Dam (Photo I-25). It was presumably used for either a tailings delivery pipeline or to allow a power line conduit to cross the dam crest during operations. It is currently unused. The invert is at approximately 1.0 m below the Southwest Dam crest, or about 0.9 m above the spillway invert (El. 1096.7 m). The culvert should be removed during closure activities but is not a dam safety issue.
- In 2019, a 1.1 m deep void with a diameter up to about 0.2 m was discovered around the steel pipe protecting the PVC standpipe for piezometer P89-01, located at the downstream edge of the dam crest. The void was backfilled in 2019 with locally derived glacial till fill. The void is believed to be the result of an improperly backfilled drill hole and not indicative of internal erosion. The standpipe was inspected in 2020 and no new soil movement or soil loss was observed (Photo I-35).
- Five pairs (10 total) of vibrating wire piezometers with data loggers were installed in 2017. Piezometer data was downloaded during the 2020 DSI site inspection; data plots are in Appendix II.
  - ◆ Two locations (DH17-02 and DH17-05) which had previously shown spurious high readings had been repaired with bentonite surface collars in 2019. This repair has appeared to remove the spiking readings (presumably correlated to rainfall events). Instead, now, these two piezometers appear to fluctuate according to (presumably) pond level.
  - ◆ Two piezometers have ceased functioning since our August 2019 site visit - DH17-04A in September 2019, and DH17-05A in June 2020. The reason for this failure is not known. Neither had shown unusual readings before failing.
  - ◆ The steel bar riser which supported the dataloggers for DH17-02A and DH17-02B has snapped at the base likely due to high winds (Photo I-36).

- Two standpipe piezometers, P89-01 and P89-06 were read by dip-metre, showing piezometric levels consistent with past readings.

### 4.3 Instrumentation Review

#### 4.3.1 TSF Pond Water Level

The pond level is passively maintained via the spillway and is not regularly monitored. Two water level staff gauges have been installed in the pond, one at the northwest corner near the landfill, and one at the spillway. Both showed a measurement of 0.335 m – this coincided with a measured water depth of 80 mm at the spillway invert (El. 1096.69 m). The pond level has historically been within 0.1 m of the spillway invert, so the readings were consistent with past observations.

#### 4.3.2 Piezometer Readings

##### Vibrating Wire Piezometers

Data from dataloggers monitoring the five pairs (10 total) of Vibrating Wire Piezometers (VWPs) was reviewed. Hourly readings are plotted on Figures II-1 to II-6 in Appendix II, from July 2017 to August 2020. The VWP readings have not been corrected for fluctuations in barometric pressure.

- Three instruments (DH17-02A, DH17-02B and DH17-05B) show readings that correlate with precipitation and pond level. It appears that local low spots on the crest resulted in water ponding at the base of the piezometer installations. In 2018, the fill around the base of these piezometers was regraded and fine-grained material was placed at the base to create a mound around the instruments. This proved ineffective, so in 2019 a bentonite collar was constructed by digging down 0.3 m within 0.8 m of the instrument, placing a layer of bentonite chips, and backfilling this excavation. The bentonite collars have smoothed out the irregularities in the readings from precipitation or water ponding in the drillhole, and now fluctuations seem to more likely follow the pond level. These three piezometers show an annual fluctuation range of about 1.5 m since September, 2019.
- Five of the remaining seven piezometers show seasonal fluctuations ranging from 0.5 m to 1.0 m since September 2019.
- Two of the piezometers, DH17-04A and DH17-05A stopped functioning since September 2019, and June 2020 respectively. It is not clear what caused the malfunction. There were no unusual readings prior to the malfunction. A review of potential issues with the vibrating wire piezometers or dataloggers should be conducted with the supplier, RST Technical.
- Piezometer levels are lowest in the spring just before thaw (March and April), with a slight rise after spring snowmelt and during rainy periods.
- Instrument temperatures for the piezometers have remained above 0°C (see Figure II-7), thus frost penetration at the dam has not reached the depth of the instruments.

Piezometer levels from September 2017 (after readings stabilized following initial installation) to August 2020 are summarized in Table 4.1.

Interim alert levels were set in 2018 at 1.0 m above the maximum recorded level for the seven VWP's that are not responding to precipitation. If any of these levels are exceeded, the cause should be investigated. These levels should be reassessed in future DSIs as long-term trends become more apparent.

**Table 4.1 Vibrating Wire Piezometer Levels**

Instrument	Instrument Tip Elevation (m)	Maximum Recorded Level (m)	Alert Level (m)	Alert Exceedance Level (m)	Alert Exceedance Date
DH17-01A	1086.8	1091.32	1092.3	none	N/A
DH17-01B	1090.5	1091.21	1092.2	none	N/A

DH17-05A	1088.7	1094.49	1095.5	none	N/A
DH17-05B	1093.7	1096.18	1097.2	none	N/A

### Standpipe Piezometers

Two of eight standpipe piezometers near the dam crest and toe were read during the 2020 DSI site visit. Data is presented in Appendix II, Figure II-8 and summarized in Table 4.2. The reading at P89-06 was the highest recorded, exceeding the previous reading by 0.2 m but this value is still over 1.35 m below ground and is not a dam safety concern.

**Table 4.2 Standpipe Piezometers**

Instrument	Instrument Screen Elevation (m)	Maximum Recorded Water Level (Note 1) (m)	Maximum Water Level Date	2019 DSI Site Visit Water Level (m)	2020 DSI Site Visit Water Level (m)
P88-01 P1	1080.5 – 1083.6	1095.50	2008-08-28	1095.20	Not read
P88-01 P2	1086.3 – 1088.1	1095.50	2008-08-28	1095.10	Not read
P88-02 P1	1074.7 – 1077.8	1086.99	2008-08-28	1085.87	Not read
P88-02 P2	1081.8 – 1083.6	1087.03	2011-09-24	1086.36	Not read
P88-03 P1	1081.8 – 1083.6	1094.70	2008-08-28	1092.99	Not read
P88-04 P1	1079.0 – 1080.8	1089.18	2006-09-11	1088.10	Not read
P89-01	1087.8 – 1091.2	1091.86	2006-09-11	1090.90	1091.05
P89-06	1088.0 – 1089.6	1090.25	2020-08-20	1090.04	1090.25

Note:

1. Maximum water levels since 2006 reported. Readings for some instruments from before 2006 are substantially different, suggesting they may have been measured from a different datum.

## Flow Monitoring

### *90° V-Notch Weirs*

There are four 90° V-notch weirs constructed from lumber (with water-resistant paint), located at historic weir locations W3, W4, W6 and W11a (photograph in Appendix I). Several of the weir pools have filled with sediment. In August 2020, the readings were:

- W3: 0.02 m = 0.09 L/s (5 L/min);
- W4: <0.01 m = <0.01 L/s (<0.6L/min);
- W6: not flowing; and
- W11a: <0.015 m = 0.04 L/s (2.5 L/min).

These flows are slightly higher than flows recorded during the 2018 and 2019 DSI inspections, and can be attributed to the rainy weather in the days leading up to the 2020 DSI.

The weir locations should be reviewed when closure work is complete. We do not recommend further work or maintenance on the weirs until the final closure drainage configuration is established.

Measurements from the historic (temporary) weirs range from 0.2 L/min to 24 L/min, with highest flows occurring in 2011.

## 5 HYDROTECHNICAL ASSESSMENT

### 5.1 Water Management

There have been no substantial changes to TSF water management in 2020. The pond continues to be maintained with a water cover over the tailings and surplus water passively decanted through a permanent spillway on the Northeast Dam. The spillway channel directs flow to an old polishing pond east of the dam and onward down Johnny Creek and Bronson Creek to Iskut River.

A bathymetric survey conducted in 2017 indicates that when the pond is at the spillway invert, the maximum pond depth is about 6 m, and the average depth is about 2 m. The pond volume below the spillway invert is about 186,000 m<sup>3</sup>. The survey also indicates a volume of about 98,000 m<sup>3</sup> between the spillway invert at El. 1096.7 m and the dam crest at El. 1097.6 m.

#### Spillway

The spillway is about 4.5 m wide with an invert about 1 m (El. 1096.6 m ND) below the minimum dam crest level (El. 1097.6 m ND), and is armoured with rockfill, riprap, and geofabric. The spillway chute gradient is about 23% (see Figure 5). It has performed well with little to no maintenance required since construction. The spillway capacity was assessed as part of the 2017 DSI (KCB 2017a) and exceeds design requirements. The spillway was in good condition with maximum flow depth of about 80 mm as observed in August 2020.

#### Seepage Ponds and Ditches

There are seepage collection ditches and ponds at the toe of the dam. The ditches collect seepage from the dam and are functioning well. The ponds are located at the southwest corner of the TSF and at the old polishing pond location east of the spillway and flow either north to Johnny Creek or south to Stonehouse Creek. The ditches were observed with up to 60 mm depth of flow locally during the site inspections in August, 2020.

Rescan Tahltan Environmental Consultants (RTEC) installed two hydrometric monitoring stations in September 2016. Station STS-H1 is located 100 m southwest of the TSF, on a small stream that drains from the south side of the TSF to Stonehouse Creek. Station JTN-H1 is located about 100 m northeast of the TSF, at the outlet of the polishing pond on a small channel that leads to Johnny Creek.

An interception ditch diverts upslope drainage around the west side of the impoundment.

#### Polishing Pond and Saddle Berm

The old polishing pond area below the spillway is partially contained by a Saddle “Dam” (identified as such in the original design, Dick, 1989) that contains the Polishing Pond and directs flow eastward toward Johnny Creek. The Saddle “Dam” also prevents spillway flow from entering Sky Creek. The Saddle “Dam” does not qualify as a dam according to the typical definition provided by the CDA (2013), i.e., at least 2.5 m high from crest to toe and 30,000 m<sup>3</sup> reservoir capacity, and is not classified as such. It is currently indistinguishable from the surrounding natural terrain. When observed in

August 2020, the polishing pond and channel to Johnny Creek were performing well. We have renamed this feature as the Saddle Berm, as it does not meet the definition of a dam.

## 5.2 Water Balance

There have been no substantial changes to the water balance in 2020. The TSF closure design (KCB 2018a) includes an update to the TSF water balance which specifically looked at average and drought conditions. The drought condition was considered for confirming minimum required water cover over the tailings. In a 200-year dry year, the water level in the TSF pond level can be expected to drop up to about 0.2 m below the spillway invert. A summary of the TSF water balance for an average year is provided in Table 5.1.

**Table 5.1 TSF Water Balance Summary – Average Year**

Flow	Input Rate	Total Volume (m <sup>3</sup> )
<b>Inflows</b>		
Rainfall	708 mm/yr	71,000
Snowmelt	1382 mm/yr	138,000
<b>Outflows</b>		
Evaporation	258 mm/yr	26,000
Seepage	9.3 m <sup>3</sup> /day	3,000
Spillway Discharge		180,000

A flood routing study (KCB 2018a) using an Inflow Design Flood of 393 mm of precipitation over 24 hours indicated a peak spillway discharge rate of 630 L/s with a peak water elevation of El. 1096.87 m at the spillway crest (0.27 m flow depth).

## 6 GEOTECHNICAL ASSESSMENT

There were no substantial changes to the geotechnical stability of the TSF in 2020. Dam stability relies on a robust closure spillway combined with a stable design section on a good foundation. Stability was last assessed in 2017 using results of the 2017 drilling and lab investigation, LiDAR survey and bathymetry survey, along with the new vibrating wire piezometers to provide additional information on embankment zonation, material properties, slope geometry, tailings geometry, and piezometric levels in the embankment.

The primary findings of the 2017 assessment were that in some areas, the downstream slope does not meet HSRC (2017) factor of safety requirements for shallow slip surfaces for static and seismic loading, and therefore flattening the downstream slope to 2.5H:1V should be completed to improve stability of the surficial material. This lower factor of safety was evident in 2020, when a small slump (about 3 m<sup>3</sup> total volume) occurred on the outer slope of the Northeast Dam access ramp. The outer slope of this ramp is not considered part of the dam fill and is steeper than 2H:1V. The slump occurred in this steep ramp side-slope but does not comprise a dam safety risk, rather it is an indicator of the potential behaviour of the material at slopes steeper than 2.5H:1V

Factor of safety requirements for deep slip surfaces are met in the current configuration, even if the blanket drain ceases to function. Additional details of the stability analyses are given in the TSF Closure Design report (KCB 2018a).

Surveillance and maintenance items related to the dam stability include:

1. Monitoring the piezometric surface within the dam embankment (vibrating wire piezometers and standpipe piezometers).
2. Monitoring seepage rates and potential migration of fines in seepage at four weirs at the dam toe.
3. Inspections of the dam and spillway up to three times a year during the field season, from approximately June to October, including an annual inspection by the Engineer of Record.
4. Slope and crest maintenance during the field season from June to October, as required.
5. Monitoring the TSF year-round via internet camera.

## 7 HYDROGEOLOGY AND GEOCHEMICAL ASSESSMENT

### 7.1 Water Quality and Geochemistry

Water quality monitoring at Johnny Mountain began in 1986 and has been ongoing at Johnny Creek and Stonehouse Creek. Water quality monitoring of discharge from the TSF began in 1989. The program is outlined in the May 2000 amendment to Waste Management Act Permit PE-8415, and a water quality monitoring program was then initiated in 2001 including additional sampling stations and monitored parameters. The 2020 results are provided in the 2020 PE-8415 Annual report provided to MECCS, which is also included in the SnipGold 2020 Annual Reclamation Report (requirement of Johnny Mountain Mine Mines Act Permit M-178). The tailings pond outflow, measured at station JM5 (Figure 7.1) since 2006, has met the Permit PE-8415 conditions for dissolved copper (limit 0.05 mg/L) and dissolved zinc (limit 0.2 mg/L).

**Figure 7.1 Water Quality Sampling locations (Greenwood 2016)**

## 8 DAM SAFETY MANAGEMENT

### 8.1 Review of Operation, Maintenance and Surveillance Manual

A “Closure Management Manual” (SnipGold 2015) combined with the SnipGold Standard Operating Procedure for all employees and the site Emergency Response Plan (SnipGold 2017) provide the basis for the site operation, maintenance and surveillance. A new Operation, Maintenance and Surveillance manual for the TSF was prepared in early 2018 (KCB, 2018d) and includes maintenance and surveillance requirements as well as updates the ERP.

There are no active operations at the TSF. Plans are being prepared for relocation of potentially acid-generating rock from various points on the site into the TSF. The scope of this work and the implementation are documented in a 2020 Project Execution Plan (PEP) prepared by SnipGold (2020).

Key elements for surveillance and maintenance currently in place are:

- Regular inspections of the site and TSF when staff are at the Iskut Camp, and the site is accessible. The site weather station is internet connected and has been operating since October 2016. In the past, regular observation of the TSF was possible by internet connected camera; however, as of March 2019 the internet connection is inoperable. Station data (including photographs) is downloaded by ERM when they conduct site visits for water quality testing.
- Annual dam safety inspections of the TSF by the EoR. This includes visual observations of the dam condition, with photographs at regular photo stations, observations of the spillway condition, monitoring instrumentation and an annual report.
- A DSR at least every five years as per the revised HSRC (MEM 2017).
- Surveillance includes annual readings of the weir levels, annual readings of standpipe piezometers, and hourly (datalogger) readings of the vibrating wire piezometers (checked annually).
- The pond freeboard is checked annually at the spillway. The spillway invert is 1.0 m below the lowest point on the dam crest.
- Maintenance includes regrading of the main access road to the TSF, and, when required grading or clearing out of water collection ditches at the toe of the dams.
- Maintenance records are kept in the SnipGold Smithers office.
- All site staff are required to report of any noted spill, instability or unusual condition.

We recommend the following changes for the next OMS Manual update, which should be completed when closure construction works are complete:

- Add Quantitative Performance Objectives for the vibrating wire piezometers. These levels should be set 1 m above the maximum recorded level (See Section 4.3.2).

- The OMS should include the updated TSF inspection form (provided in the 2019 DSI, KCB, 2020).

## 8.2 Review of Emergency Response and Preparedness Plan

There is an Emergency Response Plan (ERP) for emergencies at the camp and for the exploration team. We understand this is updated annually before the field season with current phone numbers and contact information and included in the OMS along with emergency procedures and notifications in the event of a TSF incident and dam breach inundation maps.

The ERP includes informing the Mine Manager immediately, who will coordinate response to the emergency, including notifying others for immediate response and notifying others in the chain of responsibility.

The ERP includes communication protocols, contacts and current phone numbers, and emergency response procedures related to: medical, fire, aviation, rescue, overdue crew, wildlife and hydrocarbon spills, tailings spills, tailings high inflow events, and TSF embankment instability.

## 8.3 Public Safety Management

The site is remote and not easily accessible to the public. Access is limited to helicopter, or vehicle from Iskut Camp which is accessible by small plane (using Bronson Creek Airstrip). The airstrip at Johnny Mountain has been dug up. The public safety risk posed by the TSF is considered to be low.

## 8.4 Risk Assessment

The HSRC requires a risk assessment that reviews, characterizes, and where appropriate, mitigates risks of operating the TSF. Risks are to be documented and managed to a level appropriate to the structure's consequence classification. Risk assessments are required for all TSFs, but for those TSFs with a classification of "High" or above, a formal independent risk assessment is to be conducted. As the current consequence classification is "Significant", an independent risk assessment is not required.

A risk assessment was completed as part of the 2017 DSI to identify all critical risks associated with the TSF, assess impacts associated with those risks, to inform design alternatives, develop design objectives and to determine monitoring objectives. Risks are potential outcomes based on a combination of potential hazard and probability of occurrence. There have been no significant changes in 2020, that would change the 2017 risk assessment.

Potential risks and KCB's view of each, from the 2017 risk assessment, are summarized below. In KCB's opinion, the risks on site are appropriately managed, and will be further reduced by the proposed closure works.

1. **Failure Mode:** *Dam foundation failure leading to a dam failure and release of tailings, under seismic loading leading to undrained strength failure.*  
To manage this risk, the dam should meet design criteria for global stability based on potential slip surfaces through the foundation. This failure mode was presented and reviewed in the

TSF Closure Design report (KCB 2018a). The dam meets global stability requirements, and the foundation is safe. The risk of a seismically induced, static or undrained strength failure of the foundation is low due to the foundation being comprised of dense till over bedrock.

2. **Failure Mode:** *Dam embankment stability failure leading to a release of tailings under static stability or seismic loading.*

To manage this risk, the dam should meet design stability criteria for both upstream and downstream slopes. The dam generally meets stability criteria for deep-seated slip surfaces and the risk of a seismically induced, peak or undrained strength failure of the embankment is low due to downstream embankment construction over dense till or bedrock. However, the assessment (KCB 2018a) indicated the potential for local, minor surficial slumps on the downstream face, and that some minor surficial slumps may have occurred during the last 30 years. The small slump on the northeast access ramp in 2020 is typical of these types of slumps. Slumps have been repaired on the upstream face in 2017. The downstream minor surficial slumps are not global stability risks; however, they could regress over time causing narrowing of the dam crest and potentially a dam failure if left unattended or unrepaired for an extended period. The dam is under regular surveillance which appropriately manages this potential risk, and there are plans for flattening the slopes for long-term closure.

3. **Failure Mode:** *Failure of the blanket underdrain system raising the phreatic surface in the dam.*

The phreatic surface is to be maintained below acceptable levels for embankment stability. The dam was designed with a granular underdrain to lower the phreatic surface in the embankment slope. To manage this risk, the stability of the dam was checked assuming a non-functioning underdrain. Surface slumps or excess dam fill have covered much of the toe of the dam and so seepage paths from the drain are at least partially blocked. Seepage analysis and measurements at the new piezometers indicates that the drain is functioning and keeping the piezometric surface in the embankment at acceptable levels below the dam crest. Furthermore, updated analysis of the dam stability showed that after closure works are implemented, including flattening the downstream slope to 2.5H:1V, the embankment will continue to meet stability design criteria even with a fully blocked blanket drain.

4. **Failure Mode:** *Piping of fines through the granular underdrain could lead to dam failure.*

To manage this risk, the drain material should be properly designed to be filter compatible with the dam embankment fill. The Dam Safety Review report (KCB 2017b) included a review of filter compatibility which indicated some potential for gap-graded dam fills and gap-graded blanket drain fill, which could, under a significant gradient, lead to potential loss of fines through the drain or potential internal instability within the drain. Drilling in 2017 indicated that there has likely been fines migration into the blanket under-drain over time resulting in the drain, in some locations, being indistinguishable from the till. Nevertheless, the volume of seepage is low, and there has been no recent evidence of dam settlement, fines in the seepage or other indicators of piping of fines. The void discovered around P89-01 during the 2019 DSI site visit is believed to be the result of an improperly backfilled drill hole and not associated with internal erosion. Ongoing monitoring of seepage for fines is now part of the

annual inspections. The drain is to be extended under the new planned downstream 2.5H:1V slope. The drain extension will be designed to act as an inverted filter to impede any potential transport of fines.

5. **Failure Mode:** *Failure of the spillway leading to dam overtopping or breach.*  
To manage this risk, the spillway should be adequately sized and designed. The spillway capacity to carry the required Inflow Design Flood for a dam failure consequence classification of Significant (1/3 between the 975-year flood and the PMF), has been reviewed and confirmed. The closure design includes recommendations for some upgrades to armouring of the spillway to improve erosion resistance under design flows (KCB 2018a).
6. **Failure Mode:** *Failure of upstream diversions, causing additional storm runoff into the TSF.*  
To manage this risk, the spillway capacity should be adequately sized to include inflows if diversions are breached. The landfill and area upstream is effectively part of the TSF catchment. A new water balance, conducted in 2017 now includes this area in the catchment in terms of inflows to the TSF. Spillway capacity has been checked and is adequate to pass-through the design storm.
7. **Failure Mode:** *Internal erosion of dam fill initiated by animal burrowing in the dam.*  
Marmots have previously burrowed up to 1.2 m deep holes into the downstream face of the dam, which have been backfilled. If left unattended, deeper burrows could initiate internal erosion of the dam fill, particularly if they reach the phreatic surface and create a new seepage path. This risk is managed by making periodic inspections over the summer and backfilling burrows as they are discovered. Since the original backfilling of burrows in 2017, annual burrowing activity has been limited to shallow (less than 0.2 m) holes, which have been backfilled during routine inspections.

These potential risks have been summarized in the OMS Manual (KCB 2018d) issued in March 2018. The OMS Manual includes instrumentation, surveillance and maintenance requirements to manage these risks.

## 8.5 Site Historic Incidents

The facility has performed well and is stable.

There are no significant site historic incidents regarding dam stability or operations other than a small slump on the Northeast Dam in 1994, repaired by constructing a buttress.

Two marmot holes were found in the Southwest embankment in 2017 and backfilled with local glacial till. Marmots dug out one of these holes by July 2018, at which time the hole was again backfilled. A new marmot hole was found in the Southwest Dam during the 2018 DSI and backfilled with some redigging noted in 2019. There was no evidence of marmots re-digging previously backfilled holes during the 2020 DSI. These should continue to be monitored for further activity as part of the normal inspections. A larger marmot den is located beyond the toe of the Southwest Dam. Marmots also inhabit the landfill to the north of the TSF.

Based on a LiDAR survey conducted in 2017 and the inspections in 2018, there have been localized surficial slumps around the downstream slope, causing local over-steepened slopes ranging from

1.9H:1V to 2.5H:1V. As previously discussed, these do not represent a risk to the global stability but if left unaddressed for an extended time, could eventually lead to a regressive failure. A slough of about 3 m<sup>3</sup> was noted on the northeast ramp in 2020 – but with no direct impact on the dam fill.

Mitigations include ongoing site surveillance requirements in the OMS Manual (KCB 2018d) and slope flattening as part of the planned closure design (KCB 2018a).

## 9 CLOSURE AND RECLAMATION

An updated closure design for the TSF was prepared in 2017, which supplements the 1999 Closure Plan (Skyline 1999). This TSF Closure Design report (KCB 2018a) provides design recommendations to upgrade the dam, place PAG waste rock in the TSF and update the long-term monitoring plan.

The design also includes minor upgrades to the spillway, with additional armouring, along with upgrades to the seepage collection ditches at the toe of the TSF. A scope for the design of the closure works is currently being considered by SnipGold. Some of this work was planned for 2020, but was postponed due to difficulties around mobilizing during the COVID-19 pandemic.

The TSF is currently considered in Active Closure, but the intent is to transition to Passive Closure (KCB 2018a). Active Closure involves the on-going operation, inspection, monitoring and maintenance of the TSF and supporting infrastructure. Passive Closure involves no further changes or actions for the TSF to operate safely. Aside from required maintenance identified during DSIs or DSRs, dams in passive closure should be stable with low maintenance (CDA 2014).

## 10 SUMMARY OF FINDINGS AND RECOMMENDATIONS

In KCB's opinion, the facility was functioning safely and as intended at the time of our inspection.

Recommendations and orders from previous inspections that have not been closed out and from the current 2020 DSI are summarized in Table 10.1. Previously closed recommendations (prior to 2020) are not listed. Recommendations have been prioritized using the suggested scheme from the HSRC Guidance Document (HSRC 2016), provided in Table 10.2.

In response to Order 2017-01 (listed in Table 10.2) SnipGold requested an exemption to the requirement for an Independent Tailings Review Board (ITRB) but are awaiting response for further action. KCB issued a letter to supports this ITRB exemption; a copy of this letter is included in Appendix IV.

**Table 10.1 Recommendations Summary**

Number	Item	Action Item	Priority	Timeline	Status
<b>2017 MEM (Now MEMLCI) Orders</b>					
MEM 2017-01		Order #1 - Establish an ITRB	-		SnipGold has requested an exemption (KCB letter dated March 29, 2018 see Appendix IV). Pending MEMLCI Response.
<b>2017 DSI</b>					
2017-DSI-01	Ditch and Water Management	An overall ditch cleanup and drainage/ water management plan is to be implemented as part of the closure plan.	4	2022-03-31	Will be addressed as part of final closure of facility.
2017-DSI-02	Dam Upgrades	Since the objective is to eventually move the facility into Passive Closure, we recommend upgrades to the dam (per KCB 2018a TSF closure design) to address these surficial stability issues which will reduce long-term risk. This includes flattening of the downstream slope, minor spillway upgrades and maintaining filter compatibility of underdrains.	4	2022-03-31	Will be addressed as part of final closure of facility.
SFI-2017-06	Weirs	When a final ditch and drainage plan is prepared, relocate the weirs to optimal measuring points to more accurately measure seepage.	4	2022-03-31	Will be addressed as part of final closure of facility.
<b>2018 DSI</b>					
2018-DSI-02	Quantitative Performance Objectives	Update the OMS Manual (and field inspection form) with alert levels for the vibrating wire piezometers. These levels should be set 1 m above the maximum recorded level (See Section 4.3.2).	4	2019	Updated inspection form was included in the 2019 DSI report. Alert levels are updated in this report and should be added to next OMS Manual update.
<b>2020 DSI</b>					
2020-DSI-01	DH17-04A, and -05A Piezometer or datalogger	Review, with RST Technical potential issues that caused the malfunction of the two piezometers or their dataloggers.	4	2021	New.

Number	Item	Action Item	Priority	Timeline	Status
	Repair or abandon.				
2020-DSI-02	DH17-02 Metal Riser repair	Repair or replace the metal riser which snapped near ground surface for DH17-02 vibrating wire dataloggers.	4	2021	New
2020-DSI-03	Two Defunct Culverts	Two old metal culverts, one in the access road next to the landfill and one in the Southwest Dam should be removed as part of final closure operations. Both are well above the spillway inlet invert and neither represent a dam safety concern but should be removed during final closure activities.	4	2022	New. Will be addressed as part of final closure of facility

**Table 10.2 Priority Ranking Scheme (MEM 2016)**

Priority	Description
1	A high probability or actual dam safety issues considered immediately dangerous to life, health or the environment, or a significant risk of regulatory enforcement.
2	If not corrected, could likely result in dam safety issues leading to injury, environmental impact or significant regulatory enforcement; or, a repetitive deficiency that demonstrates a systematic breakdown of procedures.
3	Single occurrences of deficiencies or non-conformances that alone would not be expected to result in dam safety issues.
4	Best Management Practice – further improvements are necessary to meet industry best practices or reduce potential risks.

## 11 CLOSING

Thank you for the opportunity to work on this project. Should you have any questions, please contact the undersigned.

## 2020 DSI Site Visit Report

---

2020 DSI Site Visit – Johnny Mountain TSF

September 15, 2020

SnipGold Corporation  
A subsidiary of Seabridge Gold Inc.  
1235 Main Street  
P.O. Box 2536  
Smithers, BC  
VOJ 2N0

**Ms. Elizabeth Miller, M.Sc., R.P.Bio.**  
**Vice President Environment and Social Responsibility (ESR)**

Dear Ms. Miller:

**Iskut Project – Johnny Mountain Mine**  
**2020 DSI Site Visit – Johnny Mountain TSF**

## **1 INTRODUCTION**

SnipGold Corporation (SnipGold), a subsidiary of Seabridge Gold Inc. has engaged Klohn Crippen Berger Ltd. (KCB) for engineering services related to the Iskut Project – Johnny Mountain Mine (JMM) Tailings Storage Facility (TSF).

This letter documents the site visit on August 20, 2020 conducted by Mr. Neil Singh, P.Eng., of KCB, who was accompanied by SnipGold representatives: Ms. Elizabeth Miller, R.P.Bio., Jessy Chaplin, and Lionel Sequeira. The site visit is required as part of the annual Dam Safety Inspection (DSI). This letter will be appended to the 2020 DSI Report (to be issued separately), which will contain additional discussion on site observations and dam safety.

### **1.1 Logistics**

A brief summary of Mr. Singh's travel and site visit are included below:

#### **August 19, 2020**

- Travel from Vancouver to Terrace and stay overnight in Terrace.

#### **August 20, 2020**

- Helicopter flight from Terrace to Johnny Mountain TSF site, via Bell II and McClymont Landing, arriving at about 11 am. Followed Covid safety guidelines in helicopter including masks, and plastic barriers between passengers.

- Conduct dam safety inspection at Johnny Mountain TSF with Ms. Miller. Finish about 15:00:
  - ◆ Helicopter remained on site, so radio check-ins were not required.
  - ◆ Although outdoors, continued to wear masks when less than 2 metres from others.
  - ◆ Walk dam crest, toe and slopes; observe spillway, drainage ditches, and adjacent landfill; monitor piezometers and weirs.
  - ◆ No direct interactions with other site personnel at Bronson Camp to maintain Covid distancing.
- Return to Terrace via helicopter, after site visit to McClymont landing for refueling, and to the KSM camp to pick up water samples (by others).
- Weather is variable, with some rain, some clear and sunny periods.

### August 21, 2020

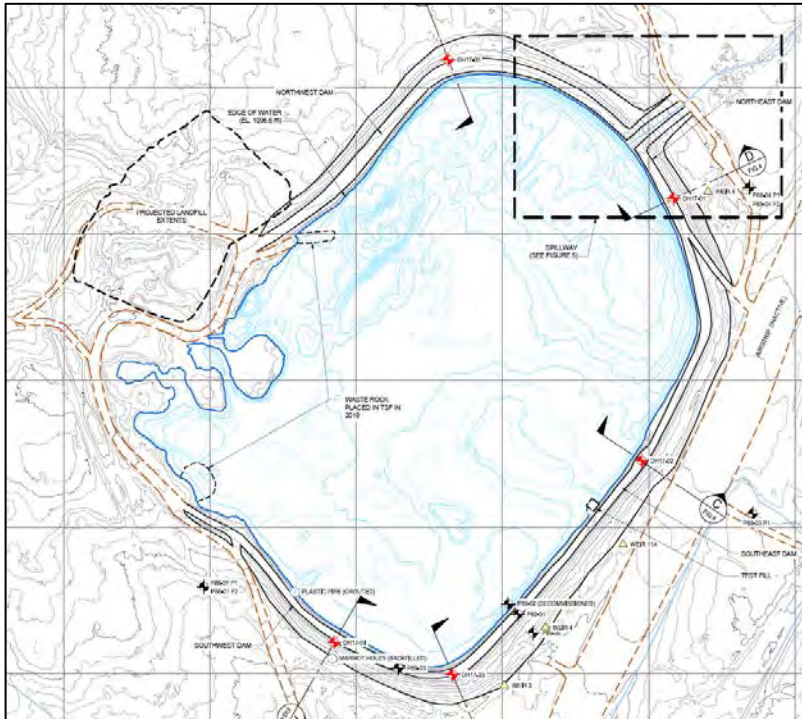

- Return to Vancouver by commercial flight.

## 2 SITE INSPECTION

### 2.1 General Observations

The site inspection checklist will be included in the Dam Safety Inspection report. Selected photographs are included with this letter in Attachment I; some 2018 and 2019 photos are also presented to provide comparison between this year and previous. Figure 1 shows the general arrangement of the TSF.

Figure 1 TSF General Arrangement

This section provides a summary of observations for the dams:

- The crest is in good condition. There is minor localized rutting and undulations, with minor evidence of ponding at low spots.
- The upstream slope is in good condition. There are minor tension cracks along some areas of the upstream crest where repairs were completed in 2017. This is due to wave erosion against the steep upstream slopes. This cracking is similar to previous years and not an immediate concern.
- Downstream slopes have minor rilling, minor slumping, and local minor erosion but are generally in good condition. Vegetation coverage is sparse, with a few small shrubs growing on the downstream slope.
- We examined areas where there had been previous minor evidence of marmot burrowing on the downstream face of the Southwest Dam near DH17-04. No new activity was observed. Marmots were observed in the landfill to the northwest but not on or near the dam.
- Seepage (damp areas) was observed on dam slopes notably on the northwest and northeast dams, and was present locally at the dam toes. The seepage is contained in the drainage ditches.
- There was no noted activity or construction in the TSF surface or dam slopes. SnipGold confirms no construction or waste rock relocation was conducted in 2020.

- The spillway is in good condition. The pond level was measured at 0.335 m on the staff gauge at both the spillway and near the landfill and up to 80 mm deep in the spillway inlet. Flow in the spillway was estimated to be on the order of 5 L/s.
- No work occurred at the landfill at the northwest corner of the TSF since the last site visit. The landfill contains metal and construction debris and is capped with till. Subsidence of the fill cover was noted, leading to sinkholes and openings on the landfill surface. The landfill is separated from the TSF pond by an access road. There is a culvert that ostensibly drains from the landfill to the TSF but it is higher than the low point of the road, and any drainage can just flow directly from the landfill to the TSF. The culvert is not needed but we see no benefit to removing it at this time – it can be removed when final closure activities are completed.
- Last year (2019) a 1.1 m deep void with a diameter up to about 0.2 m was discovered around the steel pipe protecting the PVC standpipe for piezometer P89-01, located at the downstream edge of the dam crest. The backfill and repairs to this piezometer appear to be intact, and no new soil movement or soil loss was observed.
- Four weirs were observed to have minimal measurable flow. Weir W3 has been damaged likely by a bear. No repair is recommended at this time. The v-notch remains intact. The weirs will be relocated as part of closure activities.
- Five pairs of vibrating wire piezometers (10 total) with data loggers were installed in 2017, location as shown on Figure 1. Data was downloaded during the inspection and is shown on Figure 2 attached:
  - ◆ Two locations (DH17-02B and DH17-05B) historically showed spurious fluctuations, that seemed to correlate with rainfall events. Bentonite collars added to DH17-02 and DH17-05 in 2019 appear to have somewhat reduced the fluctuations, indicating they were likely caused by surface infiltration during precipitation events.
  - ◆ Two piezometers have ceased functioning since our last site visit (DH17-04A since September 2019, and DH17-05A since June 2020). These two piezometers, which are not readable, had not shown any spurious readings before failing.
  - ◆ The steel bar riser upon which dataloggers DH17-02A and DH17-02B were mounted has snapped at the base, likely due to high winds.
- Two standpipe piezometers, P89-01 and P89-06 were read by dip-metre (at the Southeast Dam crest and toe respectively). They showed piezometric levels consistent with past readings (within 0.15m).
- A 450 mm diameter corrugated metal pipe (CMP culvert) is located in the Southwest Dam. It was presumably used for either a tailings pipeline or to allow a power line conduit to cross the dam crest during operations, but is currently unused. The invert is at approximately 1.0 m from the dam crest, which is estimated to be El. 1098.6 m. Thus, the culvert invert is about El. 1097.6 m or about 0.9 m above the spillway invert (El. 1096.7 m). The culvert should be removed as part of closure plans but is not a dam safety issue.

- A small slough – about 2m by 3 m by 0.5 m was noted on the northeast dam access ramp, south of the spillway. It is a small surficial slump and does not affect the dam directly. This is not a dam safety issue but should be monitored and repaired if it increases as it could impinge on the access road.

### **3 SUMMARY**

The dam appeared to be in good condition at the time of inspection. No significant dam safety concerns were identified. The minor cracking on the upstream slopes and the minor rilling erosion and slumping on the downstream slopes are not immediate dam safety concerns and are expected to be addressed by the pending closure works.

We will follow-up with RST Instruments to assess the problems with the two non-readable piezometers and a replacement steel riser for DH17-02.

## 4 CLOSING

This report is an instrument of service of Klohn Crippen Berger Ltd. The report has been prepared for the exclusive use of SnipGold Corporation for the specific application to the Johnny Mountain Mine. The report's contents may not be relied upon by any other party without the express written permission of Klohn Crippen Berger. In this report, Klohn Crippen Berger has endeavoured to comply with generally-accepted professional practice common to the local area. Klohn Crippen Berger makes no warranty, express or implied.

Use of or reliance upon this instrument of service by the Client is subject to the following conditions:

1. The report is to be read in full, with sections or parts of the report relied upon in the context of the whole report.
2. The observations, findings and conclusions in this report are based on observed factual data and conditions that existed at the time of the work and should not be relied upon to precisely represent conditions at any other time.
3. The report is based on information provided to KCB by the Client or by other parties on behalf of the client (Client-supplied information). KCB has not verified the correctness or accuracy of such information and makes no representations regarding its correctness or accuracy. KCB shall not be responsible to the Client for the consequences of any error or omission contained in Client-supplied information.
4. KCB should be consulted regarding the interpretation or application of the findings and recommendations in the report.

Yours truly,

**KLOHN CRIPPEN BERGER LTD.**

  
Neil Singh, P.Eng.

## **APPENDIX IV**

### **Exemption form ITRB Requirement**

---

March 29, 2018

SnipGold Corporation  
1235 Main Street, P.O. Box 2536  
Smithers, British Columbia  
VOJ 2N0

**Elizabeth Miller**  
**Environmental Coordinator**

Dear Ms. Miller:

**Johnny Mountain Mine Tailings Storage Facility  
Exemption from ITRB Requirement**

This letter provides my endorsement of the SnipGold request to the BC Ministry of Energy, Mines and Petroleum Resources for an exemption of having an Independent Tailings Review Board (ITRB). I am the current Engineer of Record for the Johnny Mountain Mine Tailings Storage Facility which is in active care and maintenance. I conducted the 2017 Dam Safety Inspection at site, the 2016 Dam Safety Review, prepared the 2018 Operation, Maintenance and Surveillance Manual and conducted a dam breach assessment for the TSF in 2018. My reasons follow:

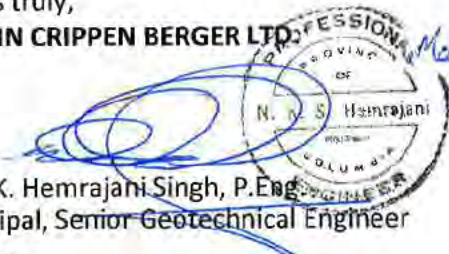

1. The site is closed and has been for many years.
2. Current closure plans, to be implemented over the coming years, will further buttress the already stable dam, will reduce the volume of water in the facility and will provide a natural erosion protection over most of the tailings surface.
3. The TSF has a Closure spillway that is in good condition, with sufficient capacity to pass the Inflow Design Flood (IDF) which functions passively and maintains the pond level below the design freeboard level.
4. New instrumentation including piezometers and weirs have been installed. Site staff are also able to monitor the TSF from a remote camera.
5. Following implementation of the closure plan, we anticipate that the TSF, which is currently classified as a Significant consequence facility, will fall into a Low consequence classification.

For these reasons we endorse the SnipGold request for an exemption of the establishment of an ITRB.

This report is an instrument of service of Klohn Crippen Berger Ltd. The report has been prepared for the exclusive use of SnipGold Corporation for the specific application to the Johnny Mountain Tailings Storage Facility. The report's contents may not be relied upon by any other party without the express written permission of Klohn Crippen Berger. In this report, Klohn Crippen Berger has endeavoured to comply with generally-accepted professional practice common to the local area. Klohn Crippen Berger makes no warranty, express or implied.

Yours truly,

**KLOHN CRIPPEN BERGER LTD.**

March 29, 2018.

Neil K. Hemrajani Singh, P. Eng.  
Principal, Senior Geotechnical Engineer

## 1. INTRODUCTION

The Johnny Mountain Mine (JMM) is a former underground gold mine located in the Coast Mountain Range, approximately 100 km northwest of Stewart, British Columbia (BC; Figure 1-1). Mine operations ceased in 1993 and reclamation activities have occurred sporadically from 1999 to 2016. Seabridge Gold Inc. (Seabridge) acquired SnipGold Corp. (SnipGold) and its properties in 2016.

Since the acquisition, SnipGold has undertaken environmental monitoring and reclamation activities. The underground workings and portals have been reclaimed and closed as described in previous Annual Reclamation Reports.

Surface water quality monitoring is conducted in accordance with *Environmental Management Act* Permit PE-8415, *Environmental Management Act* Permit PR 7927 and *Mines Act* Permit M-178. Monitoring objectives are to detect changes to water quality at compliance points identified in the applicable permits.

There are three primary drainages (Johnny, Stonehouse and Sky creeks) flowing through the mine site and there are fish barriers on these creeks which prevent fish to the mine site.

### 1.1 Purpose

The Drainage Management Plan (DMP) addresses the following conditions in **JMM's** *Mines Act* Permit M-178:

*Condition 3: Drainage Monitoring: The Permittee shall implement a program to monitor and track changes to drainage chemistry from disturbed areas and waste materials. The program shall be capable of detecting significant metal leaching and provide early warning about the onset of ARD or increases in contaminant loadings. This program must specify the frequency, sampling type, location, parameters to be analysed, detection limits and QA/QC procedures and triggers for implementing additional mitigation works, and shall be submitted with the 2004 annual Reclamation Report due March 31, 2005, for approval by the Chief Inspector.*

*Condition 4(b): Drainage Management and Collection: The Permittee shall install weirs or other suitable flow measuring equipment at all water quality monitoring locations so that flows can be monitored when water quality monitoring is conducted.*

*Condition 5: Contingency Plans: Pursuant to condition 4 above, the Permittee must develop contingency plans demonstrating how contaminant loadings will be reduced, and receiving environment reclamation objectives will be achieved, should the underground and/or tailings mitigation strategies fail to protect against the onset of ML/ARD. Contingency Plans shall be described in the updated Closure Plan due March 31, 2005.*

### 1.2 Environmental Setting

The JMM site is situated on a sub alpine plateau at approximately 1,100 m elevation and the terrain falls off steeply around the plateau. Above the plateau, glaciers on Johnny Mountain feed streams that run through and around the mine site.

Above the decommissioned airstrip, much of the site is located on morainal till deposits exposed by a receding glacier. The deglaciated areas typically have limited soil, and where soil is present, it is

derived from glacial till and colluvium. Naturally occurring mineralization and gossan exist across the site and upgradient of mine discharges. The site is surrounded by treed, steep valleys.

The climate at the site is typical of an alpine tundra site located near the Pacific Coast. Winters include heavy snowfall and cold temperatures, and rain is common during the rest of the year.

Three main streams originate and drain from the plateau: Johnny Creek (drains to the north-northeast, and enters Bronson Creek); Stonehouse Creek (drains to the southwest and enters the Craig River); and Sky Creek (drains to the northwest and enters the Craig River). Below the plateau, Bronson Creek drains to the Iskut River. Stonehouse Creek and Sky Creek drain into the Craig River, then into the Iskut River, which eventually drains into the Stikine River, which flows west to the Pacific Ocean.

### 1.3 Reclamation

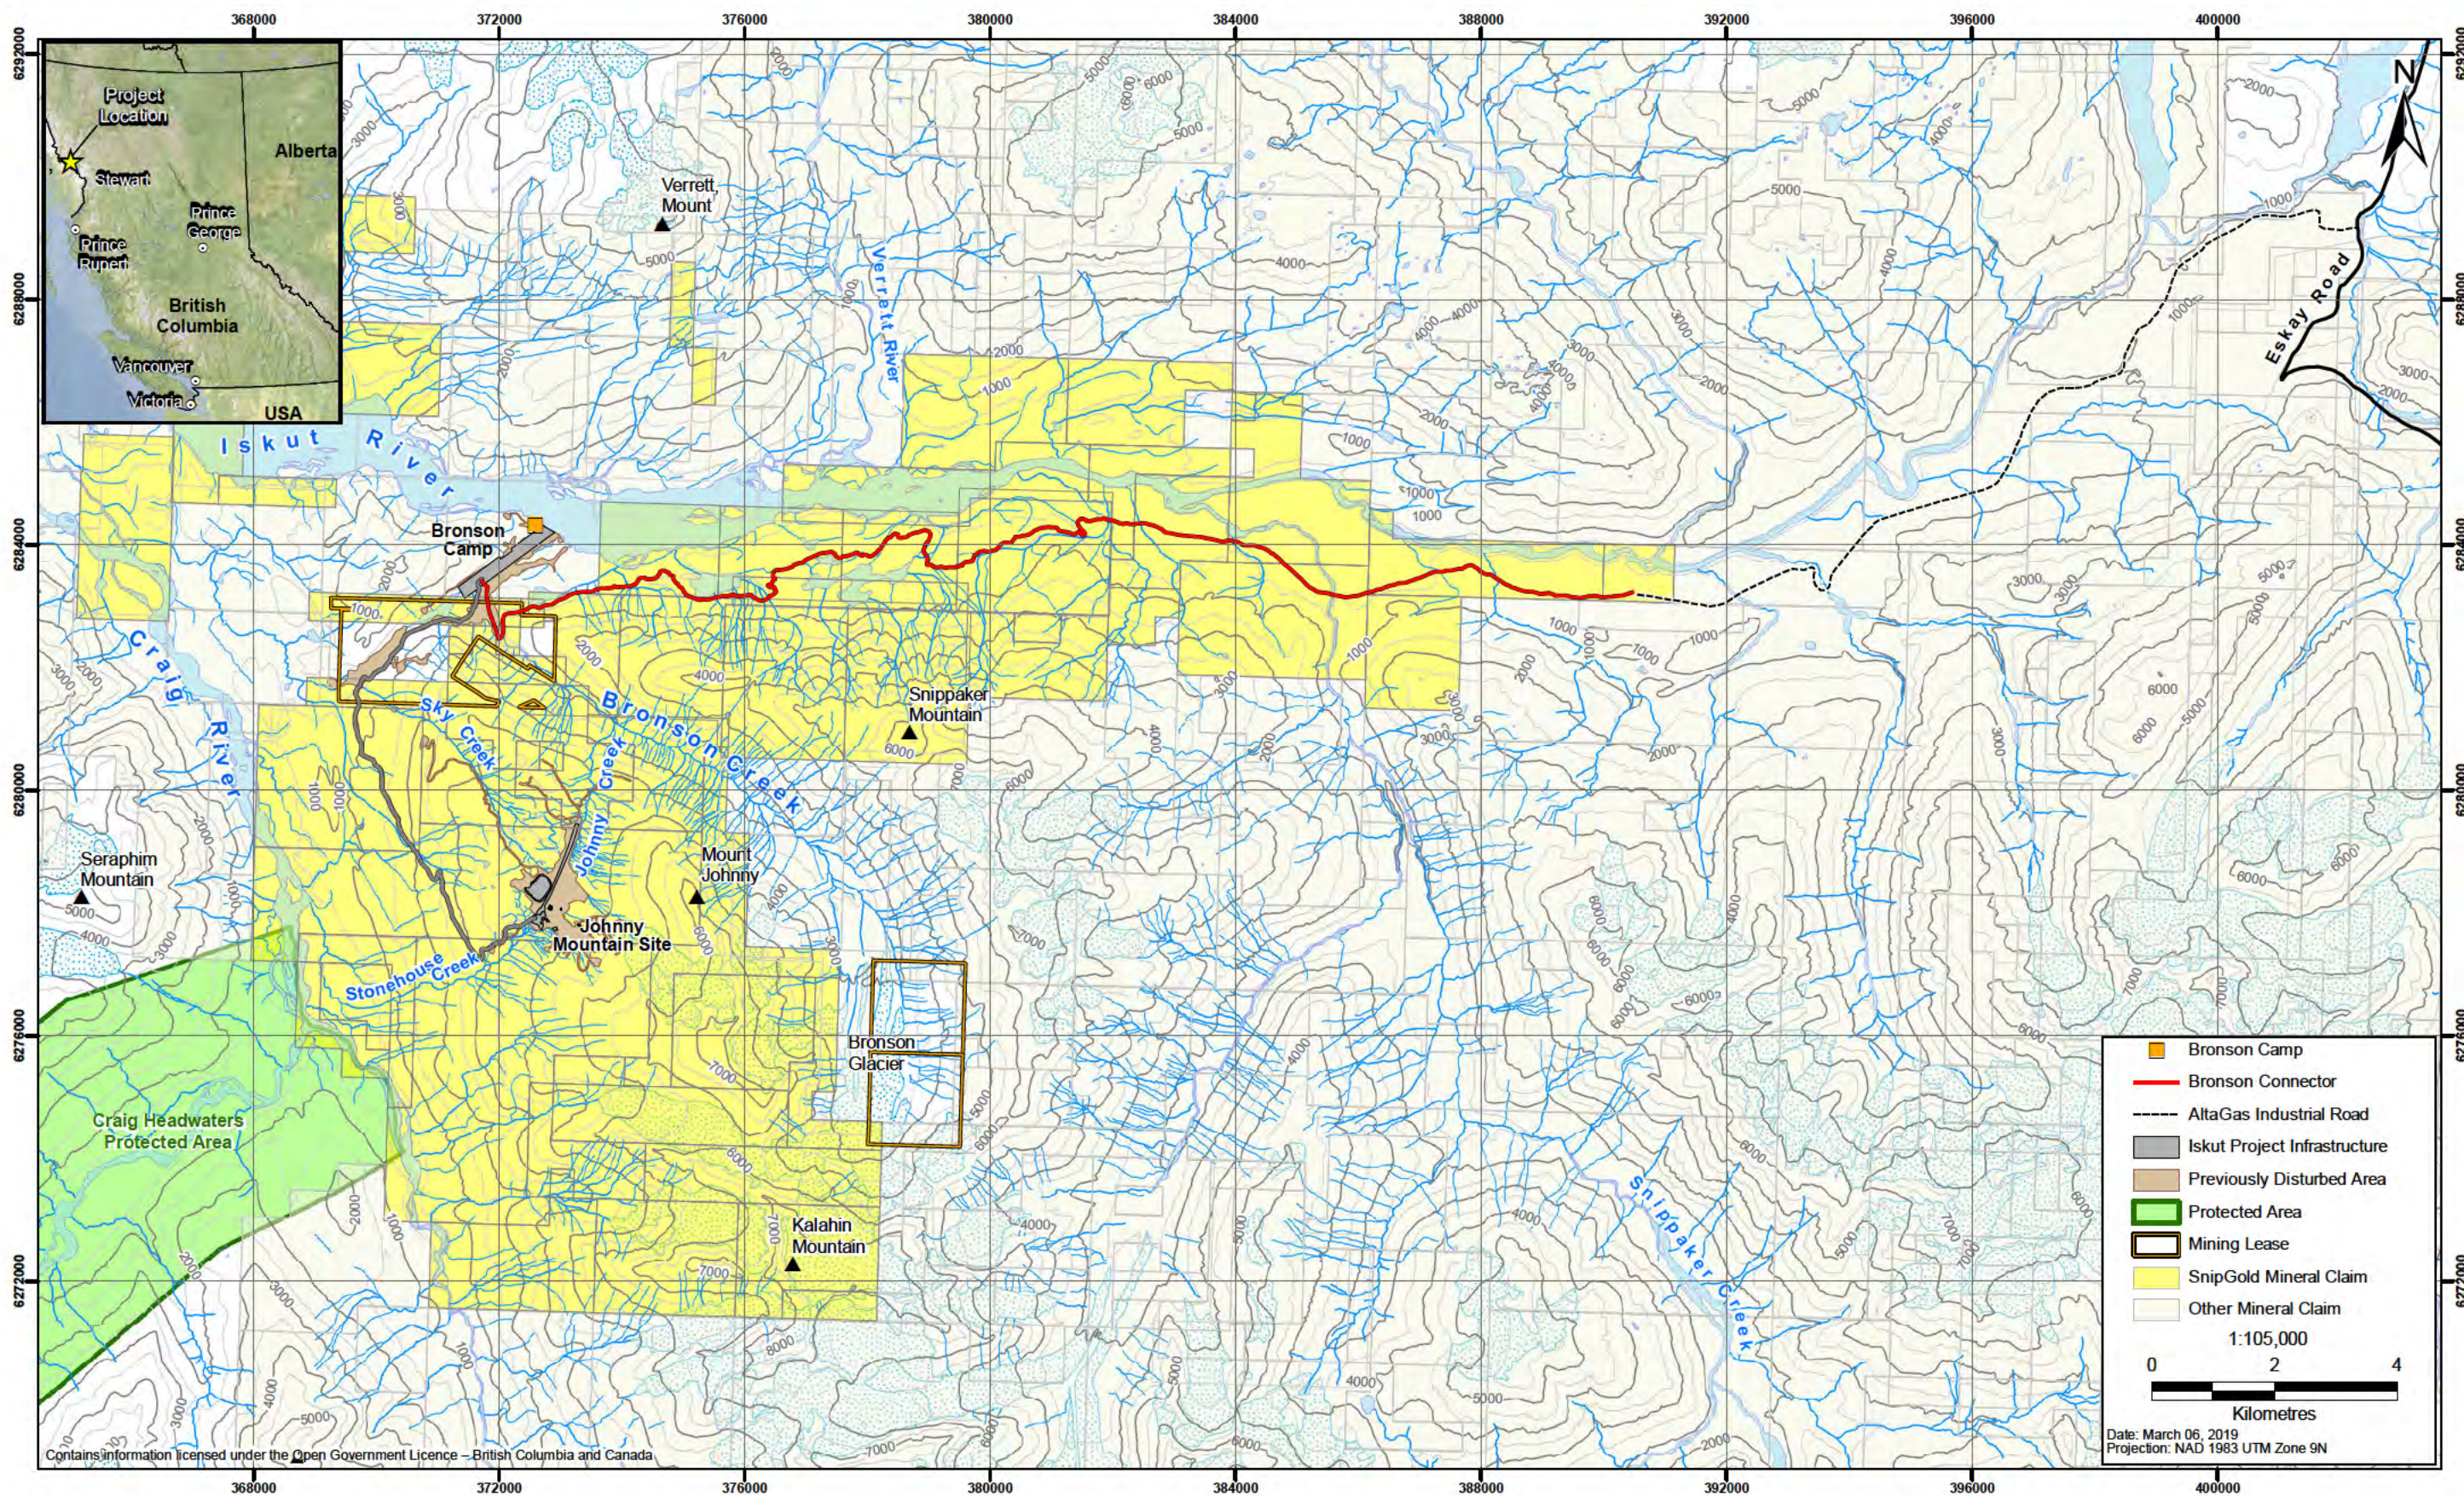

Reclamation that has been completed at the JMM by SnipGold since its 2016 acquisition are detailed in the JMM 2019 *Mines Act* Permit M-178 Annual Reclamation Report (RTEC 2019). These activities include relocation of material to the main landfill, deconstruction of the mill building, in situ remediation of contaminated soils, trial placement of potentially acid generating material (PAG) excavated from the decommissioned airstrip as well as other opportunistic activities. Future reclamation activities include: decommissioning of remaining site infrastructure; removal of waste materials from the surface of the site and subsequent re-vegetation of target areas; excavation and treatment with hydrated lime and removal of the waste rock pads to the tailing storage facility (as per Permit M-178); and continuation of in-situ remediation of hydrocarbon contaminated soils (RTEC 2019).

Since the SnipGold acquisition, Seabridge has conducted additional geochemical characterization studies as follows:

- In July 2017, as part of an evaluation of potential closure scenarios for the tailings impoundment, ABA analysis and elemental abundance methods were conducted on 27 tailings samples collected from within the tailings pond. The majority of samples (n=22) were classified as PAG or acid-generating, which confirmed the pre-mining assessment that the tailings material should continue to be submerged to manage ML/ARD (RTEC 2017).
- In 2017, an overview assessment of PAG rock was conducted to inform reclamation activities. This assessment included a visual inspection of ML/ARD indicators (e.g., signs of visible limonite staining) and the collection of 29 waste rock samples for geochemical analyses from the portal pad areas and the decommissioned airstrip. A subset of 15 samples were analyzed using ABA and elemental abundance methods, and three composite samples were assessed for mineralogical content and static leach testing (RTEC 2018). The assessment found that the majority of the waste rock samples were classified as PAG or acid-generating (n=10), or had an uncertain potential for acid generation (n=4).

Pursuant to Permit M-178, relocation of waste rock to the TSF from the airstrip and portal pads will occur over time.

Figure 1-1  
Johnny Mountain Mine: Regional Location and Land Tenures

## 2. DRAINAGE MONITORING PROGRAM

### 2.1 Geochemical Characterization

Waste materials with the potential to generate metal leaching / acid rock drainage (ML / ARD) include tailings and waste rock, and exposed rock faces in the underground workings. Prior to mining, tailings were identified as having the highest ML/ARD potential and consequently the mine plan provided for the placement of tailings in a flooded impoundment to limit sulphide oxidation (Price and Yeager 2004). Prior to mining, waste rock was assessed as having little to no ML/ARD potential based on an ARD assessment consisting of five waste rock samples (Price and Yeager 2004). During mining, ARD potential was assessed by visual observations of sulphide mineralization (Price and Yeager 2004).

After mine operations commenced, ML/ARD potential analyses carried out in the 1990s and early 2000s found that most of the waste rock was either PAG or the potential for acid generation was uncertain, based on the following:

- In 1990, acid-base accounting (ABA) analysis was conducted on 57 samples collected from the waste dumps at the portal areas, the Magazine Road and the airstrip. The analysis concluded that ARD potential is likely from approximately 50% of the waste rock and uncertain for 35% of the waste rock (Price and Yeager 2004).
- Kinetic testing of waste rock during the 1990s, including humidity cell tests and the construction of three waste rock field tests, found potential for ML (Price and Yeager 2004).
- Field test pad leachate monitoring from 1995 to 1997 demonstrated potential for ML. These field test pads were subsequently discontinued and there is no evidence of the test pads at the site.
- A general assessment of ARD prediction methods in 1994, including analysis of various size fractions from the waste dumps and ABA analysis, found waste dump material is PAG (Price and Yeager 2004); and
- In 2003, ABA analysis was conducted on <2 cm grab samples collected from the Magazine Road and the airstrip. This analysis concluded that the south end of the airstrip was either PAG or had uncertain ARD potential, and the north end of the airstrip had a lower sulphide-sulphur content and was not PAG (Price and Yeager 2004).

### 2.2 Water Quality Monitoring

The drainage water quality monitoring program is designed to monitor and track changes to drainage chemistry from disturbed areas and waste materials, including the portal areas and the TSF.

#### 2.2.1 *Field Monitoring*

Current monitoring locations are shown in Figure 2.2-1. Table 2.2-1 describes the monitoring locations and identifies the sample type and sampling frequency. Table 2.2-2 identifies the monitored parameters and their detection limits based on Permit PE-8415. Drainage water quality monitoring procedures consider Clark (2013), and follow the procedures outlined in the *Johnny Mountain Mine: Closure Water Monitoring Program* (RTEC 2020; Appendix B of the Closure Management Manual).

Table 2.2-1: Drainage Water Quality Monitoring Locations, Sample Type and Sampling Frequency

Station	Easting	Northing	Location Description	Sample Type	Sampling Frequency <sup>2</sup>
JM1 <sup>1</sup>	373272	6277784	12-Level Waste Rock Seepage, mine water source	Water	Annually
JM2 <sup>1</sup>	372834	6277774	11-Level Waste Rock Seepage, mine water source	Water	Annually
JM3 <sup>1</sup>	372514	6277926	10-Level Waste Rock Seepage, mine water source	Water	Annually

<sup>3</sup> Units are mg/L unless otherwise noted.

### 2.2.2 *Quality Assurance / Quality Control*

Drainage water quality monitoring includes field duplicates and blanks for quality assurance/quality control (QA/QC) purposes. Duplicate samples enable the identification of field sampling error and environmental variance. Blanks are used to detect contamination in samples due to storage and transportation.

Duplicate samples involve collecting two samples at the same location and same time, by the same person, using the same equipment, and same procedures. In accordance with Permit PE-8415, the duplicate sampling location is site JM8. A minimum of one duplicate sample is collected per sampling event.

One set of field and travel blanks is included with each sample set that is submitted to the laboratory. Travel blanks are pre-filled with distilled/deionized water by the laboratory, remain with the sample bottles during sampling and transportation, and are not be opened at any time. Field blanks consist of distilled/deionized water and are prepared in the field using the same methods as regular samples (e.g., addition of preservatives). In accordance with Permit PE-8415, the field blank is identified as site JM9.

### 2.2.3 *Water Quality Data Evaluation*

#### 2.2.3.1 *Data Management*

Water quality data is **uploaded and stored in SnipGold's environmental, health and safety database**. Water quality data is reviewed for anomalous readings and any discrepancies are addressed at the time of writing the annual drainage monitoring report.

#### 2.2.3.2 *Data Analysis: Screening for Water Quality Criteria*

Water quality results are compared to the Permit PE-8415 limit for JM5 and trigger limits (see Section 6). While data for other water quality parameters is collected (Table 2.2-2), data analysis focuses on the parameters identified in Permit PE-8415. For data analysis, measurements below the realized detection limit (DL) are replaced with half the realized DL. Duplicate samples are averaged for the analysis.

For pH, hardness, and dissolved organic carbon (DOC) dependent guidelines, the sample specific pH, hardness, and DOC values are used to set the guideline limit.

Water quality data evaluation considers technical guidance including ENV (2016b).

## 2.3 *Flow Monitoring*

The passive discharge of water from the TSF and the portals is monitored to estimate flows at water quality monitoring locations as required by Condition 4(b) of Permit M-178.

### 2.3.1 *Field Monitoring*

Drainage flows are monitored continuously at hydrometric stations installed during the open water season (June to October) and manual flow measurements (Figure 2.2-1) are taken when water quality is sampled.

Table 2.3-1 identifies the locations of flow monitoring stations, equivalent or closest water quality monitoring stations, and flow measurement methods.

Table 2.3-1: Drainage Flow Monitoring Locations and Methods

Hydrometric Station	Location	Easting	Northing	Flow Measurement Method	Equivalent Water Quality Station(s)
JTS-H1	Downstream of seepage. Small stream ~100 m southwest of the tailing pond. Discharges into Stonehouse Creek.	372609	6278081	Continuous flow measurements via installed hydrometric station during open water season (June to October)	-
JTN-H1	Downstream of passive spillway. Small stream ~230 m northeast of the tailings pond. Discharges into Johnny Creek.	372973	6278720	Continuous flow measurements via installed hydrometric station during open water season (June to October)	JM5, TMF1
P10-A	Level 10 portal discharge around the northeast side of the old mill building. Relocated in 2019 due to reclamation work to ~40 m downstream of portal discharge culvert.	372802	6277921	Continuous flow measurements via installed hydrometric station during open water season (June to October)	JM3, JM4
P11	Level 11 portal discharge upslope of the old mill building.	372955	6277725	Manual flow measurements	JM2
P12	Level 12 portal discharge upslope of the old mill building.	373324	6277787	Manual flow measurements	JM1
JC-H1	Johnny Creek ~800 m past the north end of the airstrip. Discharges into Bronson Creek.	373544	6280059	Continuous flow measurements via installed hydrometric station during open water season (June to October)	JM6, JM11, JM14
SHC-H1	Stonehouse Creek ~600 m downstream of the old mill building. Discharges into the Craig River.	372193	6277448	Continuous flow measurements via installed hydrometric station during open water season (June to October)	JM7, JM10, JM12, JM13, SHC1, SHC3
SK-H1	Sky Creek ~1.2 km northwest side of the tailings pond. Discharges into the Craig River.	372021	6279525	Continuous flow measurements via installed hydrometric station during open water season (June to October)	-

Note:

UTM NAD 83, Zone 9V

### 2.3.2 Quality Assurance / Quality Control

The hydrotechnical standards and methods are consistent with Resources Information Standards Committee (RISC;2018), which complement Water Survey of Canada (WSC 1999) standards. The Resources Information Standards Committee (2018) identifies three criteria for water level data and discharge data to assess and grade (i.e., A, B, C, E [estimated], and U [unknown]) the overall quality of hydrometric data as follows:

- o Instrumentation;
- o Field procedures; and

- o Data calculation and assessment.

#### 2.3.2.1 *Instrumentation*

Flow monitoring instrumentation and calibration/verification procedures meet the “Grade A” data collection standard as defined in RISC (2018). High accuracy recording data loggers and pressure transducers record and measure continuous water levels at hydrometric stations JTS-H1, JTN-H1, JC-H1, SHC-H1, and SK-H1. Pressure transducers are used at station P10-A and meet the “Grade C” data collection standard as defined by RISC (2018) due to low depth and unstable channel banks.

#### 2.3.2.2 *Field Procedures*

The field procedures are designed to follow Grade A in RISC 2018. These procedures include a minimum of three benchmarks at each station, more than two level checks per year, 20 or more vertical checks (each accounting for <10% of the total discharge) in manual stream flow measurements, and five or more manual flow measurements per year.

At gauging locations where channel widths are narrow, the number of vertical observations and percentage of flow in each panel of flow measurements will follow Grade C procedures.

#### 2.3.3 *Flows at Water Quality Monitoring Locations*

As per Condition 4(b) on Permit M-178, drainage flows are monitored at each water quality monitoring location. Water quality and corresponding hydrometric stations are described in Table 2.2-1.

### 3. TRIGGER ACTION RESPONSE PLAN

As stated in Conditions 3 and 5 of Permit M-178, the Trigger Action Response Plan (TARP) is “designed to detect significant metal leaching, provide early warning about the onset of ARD or increases in contaminant loadings, and specify triggers for implementing additional mitigation works.” The TARP provides contingencies in the event that existing mitigation strategies, including subaqueous disposal of PAG waste rock and tailings in the TSF, are not effective in controlling the effects of ARD and/or significant ML onset to the downstream aquatic environment.

#### 3.1 Triggers

Triggers include numerical threshold levels below either permitted discharge limits and/or receiving environment reclamation objectives that trigger specific responses in order to:

- Identify a change in the quality of the drainage;
- Avoid non-compliance with permitted discharge limits; and/or
- Avoid exceedance of receiving environment reclamation objectives.

These threshold levels are referred to as ‘Level 1 Triggers’ and ‘Level 2 Triggers’:

- Level 1 Triggers: An “alert” level. If a Level 1 Trigger is exceeded, this will result in further investigation to determine why there is a change in the drainage quality. These investigations may indicate that the observed trend is temporary or caused by a known activity, may indicate the need to identify potential effects to the downstream environment, or may indicate the need to implement readily available contingencies and initiate forward planning for more complex contingency implementation.
- Level 2 Triggers: An “action” level, at which point contingencies will be implemented to prevent a non-compliance event and decrease contaminant loadings to the receiving environment.

Trigger criteria are defined based on three categories: A, B, and C, where:

- “A” triggers are based on permit limits as defined in Permit PE-8415;
- “B” triggers are based on observed water quality at the site; and
- “C” triggers are based on receiving environment reclamation objectives to be determined per sampling event.

Specific trigger criteria are defined as follows:

- Level 1 triggers:
  - A. 80% of the applicable permit limit at JM5.
  - B. 80<sup>th</sup> percentile of the water quality observed between 2009 and 2018 (20<sup>th</sup> percentile for pH), except:
    - a. If the 80<sup>th</sup> percentile is below the detection limit, the detection limit is applied.
  - C. 80% of the receiving environment reclamation objective (defined as the higher of the short-term BC WQG-AL or an upstream reference site above mine infrastructure), to be determined upon review of results. For parameters without a relevant BC WQG-AL (i.e., dissolved zinc) or for sampling events that did not include an upstream reference site, “B” is applied.

- o Level 2 triggers:
  - A. 95% of the applicable permit limit at JM5.
  - B. 95<sup>th</sup> percentile of the water quality as observed between 2009 and 2018 (5<sup>th</sup> percentile for pH):
    - a. If the 95<sup>th</sup> percentile is below the detection limit, then five times the detection limit is applied; and
    - b. If the calculated Level 2 criterion is less than the BC WQG-AL, then the BC WQG-AL is applied.
  - C. 95% of the receiving environment reclamation objective (defined as the higher of the short-term BC WQG-AL or an upstream reference site above mine infrastructure), to be determined upon review of results. For parameters without a relevant BC WQG-AL (i.e., dissolved zinc) or for sampling events that did not include an upstream reference site, “B” is applied.

Trigger criteria have been defined for three sites monitored under Permit PE-8415: JM5, JM6, and JM7. JM5 was selected as representing tailings pond discharge. JM6 and JM7 were selected as representing cumulative influences of mining-related materials leaving the JMM plateau to the northeast via Johnny Creek (JM6) and to the southwest via Stonehouse Creek (JM7), prior to the water reaching sensitive fish bearing aquatic habitat topographically down gradient of the site. Trigger criteria are provided for these locations in Table 3.1-1 and 3.1-2 for the parameters monitored under Permit PE-8415. Hardness was excluded as there are no WQG-AL for hardness. **Note that specific values for “C” triggers are not provided as these values would be determined after reviewing sampling results.**

Table 3.1-1: Level 1 Triggers

Station	Parameter				
	pH	Sulphate	Dissolved Copper	Dissolved Iron	Dissolved Zinc
JM5	C	B= 19	A = 0.040	B= 0.030	A = 0.16
JM6	C	C	C	C	C
JM7	C	C	C	C	C

Notes:

Units: mg/L, except pH

Table 3.1-2: Level 2 Triggers

Station	Parameter				
	pH	Sulphate	Dissolved Copper	Dissolved Iron	Dissolved Zinc
JM5	C	B = 128	A = 0.045	B = 0.35	A = 0.19
JM6	C	C	C	C	C
JM7	C	C	C	C	C

Notes:

Units: mg/L, except pH

## 3.2 Action Response Plan

If a Level 1 or Level 2 Trigger is exceeded, the Project Manager or Site Manager will be immediately notified. The Project Manager or Site Manager will then initiate appropriate actions for each trigger level.

### 3.2.1 Level 1 Action Response Plan

When a Level 1 trigger exceedance is identified, the following location-specific management actions will be initiated and/or implemented (a simplified version is presented in Figure 3.2-1).

#### 1. Step 1: Investigation

Initiate an investigation into the cause of the exceedance immediately and:

- A. If the cause is known or a change of state (i.e., onset of ARD or land mass movement nearby) is evident:
  - a. If the effect can be reversed in the short-term with a known action, complete the action OR proceed to Step 2;
  - b. If the effect cannot be reversed in the short term, proceed to Step 2.
- B. If the cause is not known, proceed to Step 2.

#### 2. Step 2: Confirmatory Sampling and Analysis

Collect two additional confirmatory samples over the following two months. The sampling will include the location with the trigger exceedance as well as an upstream reference and the next downstream location.

- A. If the results indicate concentrations below the Level 1 trigger, no further action is required.
- B. If a Level 1 trigger exceedance is identified in either of the confirmatory samples, proceed to Step 3.

#### 3. Step 3: Trend Analysis

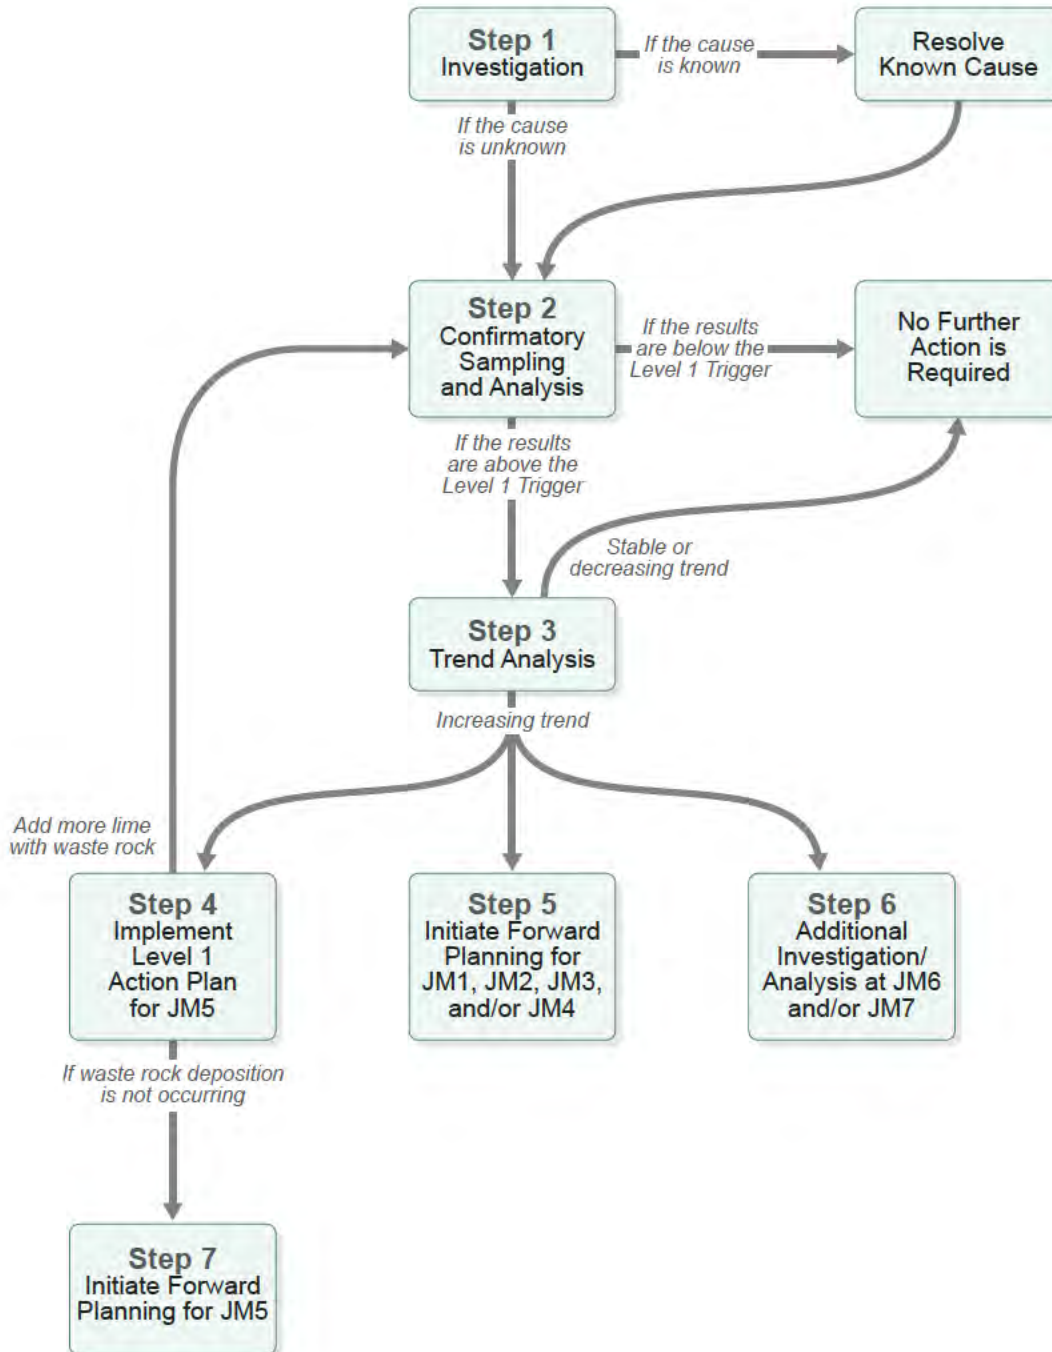

A trend analysis will be completed over the past five monitoring events:

- A. If the results indicate a stable or generally decreasing trend, consider the trigger exceedance an outlier, and no further action is required.
- B. If the results indicate an increasing trend:
  - a. If the Level 1 trigger exceedance is at JM5, proceed to Step 4.
  - b. If the Level 1 trigger exceedance is at ONLY JM6 or JM7, proceed to Step 5.

#### 4. Step 4: Implement Level 1 Action at JM5

- A. If deposition of waste rock is occurring, increase the quantity of lime being added with the waste rock. Repeat Step 2.
- B. If deposition of waste rock is not occurring, proceed to Step 6.

**Figure 3.2-1**  
**Simplified Level 1 Action Response Plan**

5. Step 5: Additional Investigation and Analysis Required for JM6 and/or JM7

Additional investigation and/or analysis is required to understand the cause of a Level 1 trigger exceedance at a receiving environment location if a Level 1 trigger exceedance is not registered at an upstream authorized discharge. This investigation and/or analysis may include, but not be limited to:

- Monitoring of additional non-mine influenced tributaries to identify potential causes for increased variability; or
- Consideration of development of science-based environmental benchmarks; or
- Re-evaluation of the Level 1 triggers.

6. Step 6: Initiate Forward Planning for Mitigating the Effect of Discharge from JM5

Forward planning will be initiated that would allow for future implementation of contingencies, which may include, but not be limited to:

- Temporarily or permanently increasing the water cover depth on the TSF; or
- Temporarily ceasing passive discharge from the TSF until water quality improves; or
- Identifying other suitable storage locations for waste rock; or
- Conducting an ecological risk assessment; or
- Other contingencies as identified based on an understanding of the cause.

3.2.2 *Level 2 Action Response Plan*

When a Level 2 trigger exceedance is identified, the following management actions will be initiated and/or implemented:

1. Initiate Steps 1 through 4 of the Level 1 Action Response Plan, as appropriate:
  - a. If concentrations remain above Level 2 triggers, proceed to Step 2.
2. Implement the appropriate contingencies identified in Steps 5 and 6 of the Level 1 Action Response Plan.

## 4. ROLES AND RESPONSIBILITIES

The SnipGold designated qualified supervisor (i.e., Project/Site Manager) will assign tasks and duties to applicable site personnel (Table 4-1). Communication of this information and sign-off by individuals will be documented and tracked. All personnel, including contractors or firms hired to complete works, share responsibility for protecting the environment.

The general approach to environmental compliance with regard to ML/ARD will be for site personnel to observe, record, and report potential concerns, and SnipGold will avoid, control, and mitigate any environmental non-compliance. Personnel will contact their supervisor immediately upon becoming aware of an incident or concern, to facilitate timely reporting of occurrences.

**Table 4-1: Roles and Responsibilities**

Role	Name	Responsibilities
Environmental Manager	Jessy Chaplin	<ul style="list-style-type: none"> <li>Responsible for overall environmental management.</li> </ul>
Project Manager/ Site Manager (PM)	To be determined (TBD)	<ul style="list-style-type: none"> <li>Responsible for overall site activities.</li> <li>Reporting to the Environmental Manager.</li> <li>Overseeing compliance with permits by regularly checking to ensure that activities are aligned with permit requirements.</li> <li>Authorizing Stop Work authority to site personnel (e.g., contractor(s)) as described in permits.</li> <li>Notifying regulatory agencies or authorizing notification of environmental non-compliance or environmental incidences.</li> <li>Reviewing site environmental monitoring report(s), including incidents, daily/weekly, and final reports.</li> <li>Providing site staff, including contractors, with the appropriate equipment and sufficient supplies.</li> <li>Reducing the potential for incidents on site by regularly monitoring the implementation of mitigation measures listed in permits.</li> <li>Directing the implementing corrective measures, when non-compliances are identified or incidents occur.</li> <li>Confirming that site staff, including contractors, are properly trained for their jobs.</li> <li>Providing notification on changes or updates to monitoring plans.</li> <li>Signing off on annual reporting.</li> </ul>
Environmental Technician (or designated contractor)*	TBD	<ul style="list-style-type: none"> <li>Reporting to the PM on permit compliance and the status of corrective measures.</li> <li>Communicating the requirements of this Plan to the PM, and onsite workers, including contractors.</li> <li>Completing environmental orientation with the site workers.</li> <li>Reviewing monitoring data as it becomes available.</li> <li>Executing the TARP.</li> <li>Providing corrective action advice to the site staff and the PM, where appropriate.</li> <li>Having the authority to issue a Stop Work Order where activities are impacting, or may impact, water/sediment quality and/or fish/fish habitat or otherwise result in non-compliance with this Plan.</li> <li>Maintaining records of monitoring, site visits and non-compliances and environmental incidents.</li> </ul>

*\* If an Environmental Technician (ET) or contractor is not designated, the responsibilities of the ET will fall on the Project Manager, or designate.*

## 5. REPORTING, DOCUMENTATION, AND RECORDS

### 5.1 Reporting

Drainage monitoring results will be provided in the Annual Reclamation Report submitted by March 31 of each year as required by Permit M-178 and will include the following information:

1. An assessment of the compliance of the previous year's drainage monitoring based on the DMP.
2. An assessment of drainage chemistry, including any detected influence of significant ML, early warnings about the onset of ARD, or increases in contaminant loadings.
3. An evaluation of monitoring data against the applicable triggers for implementing additional mitigation works.

### 5.2 Recordkeeping

Drainage monitoring results will be entered in a format and program that will allow for comparison between years. Sample locations, sampling dates and conditions, and analytical results will be retained for collected samples. A log of field notes from visual inspections and inspection photographs will also be retained. Monitoring data will be stored and will be available for review during site inspections by ENV or EMPR.

Wood accepts no responsibility whatsoever for damages or loss of any nature or kind suffered by any such third party as a result of actions taken or not taken or decisions made in reliance on this report or anything set out therein, including without limitation, any indirect, special, incidental, punitive or consequential loss, liability or damage of any kind. Submission or distribution of report to meet official regulatory requirements or for similar purposes in connection with the Project is not to be construed as a derogation of the reserved rights of Wood.

## Executive Summary

Wood Environment & Infrastructure Solutions (Wood) was retained by SnipGold Corporation (SnipGold) to complete a Supplementary Site Investigation (SSI) at the Johnny Mountain Mine (JMM) Site to support and inform the mine reclamation efforts currently in progress. The objective of the 2020 SSI was to determine current concentrations of petroleum hydrocarbons in the in-situ treatment areas; to complete further evaluation of concentrations of metals in groundwater in upstream, midstream and downstream locations and groundwater sampling required to support annual compliance monitoring requirements for Permit PR-7927. Also conducted was the sampling of surface water samples to acquire data to support an Ecological Risk Assessment (ERA) completed under separate scope and cover.

The in-field portion of the 2020 SSI was conducted in August 2020. The objectives of the 2020 SSI, built on the results of the 2019 SSI, included specific tasks to support ongoing Site reclamation work, including:

- Continuing an environmental site investigation of specific areas of environmental concern (AECs) and areas of potential environmental concern (APECs) to assess hydrocarbon impacts in groundwater within the following APECs/AECs:
  - AEC 1: Mill/10 Level Portal;
  - AEC 2: Tank Farm and Fuel Lines and AEC 3 – Fuel Pump Shed;
  - AEC 5: Main Landfill; and
  - APEC 7: Tailings Storage Facility (TSF).
- Evaluation of petroleum hydrocarbon levels in material located in the Treatment Areas 1 and 2;
- Continuing evaluation of background concentration of metals in groundwater by completing additional groundwater monitoring and sampling activities;
- Collection of surface water samples at strategic locations to support the ERA; and
- Collection of groundwater quality data at the Main Landfill, required to support annual compliance reporting requirements for Permit PR-7927.

The following conclusions were made during this assessment as they relate to the objectives and scope of work defined within this report.

### Physical Remediation – Shallow Soil Hydrocarbon Contamination

In 2020, Wood completed a year-end sampling of Treatment Area 1 and Treatment Area 2 to determine the effectiveness of the remediation program. Based on the results of the 2020 soil sampling and the data collected during the 2017 Site Investigation (2017 SI), 2018 SSI and 2019 SSI, concentrations of light extractable petroleum hydrocarbons (LEPH) have decreased significantly as shown in the following tables.

**Treatment Area 1 – 95<sup>th</sup> Percentile Over Time**

Sampling Event	95 <sup>th</sup> Percentile (mg/kg)	Average Concentration (mg/kg)
2017 In-Situ (LEPH)	3748	3138
2018 (Year End) LEPH	3582	1857
2019 (Mid-Year) LEPH	2005	1217
2019 (Year End) LEPH	1394	738
2020 (Year End) LEPH	1164	710

**Treatment Area 2 – 95<sup>th</sup> Percentile 2019 Year End Sampling**

Sampling Event	95 <sup>th</sup> Percentile (mg/kg)	Average Concentration (mg/kg)
2017 In-Situ (LEPH)	3748	3138
2019 (Year End) LEPH	2772	1619
2020 (Year End) LEPH	1292	813

**Groundwater Sampling Program - Hydrocarbons**

Groundwater impacted by petroleum hydrocarbons was identified at AEC 1 and AEC 2. Light non-aqueous phase liquid (LNAPL) was identified at monitoring well MW17-17B. Soil impacted by petroleum hydrocarbons has also been identified at those AECs during previous assessments. Contamination identified within those AECs have impacted groundwater quality.

Concentrations observed in 2020 for polycyclic aromatic hydrocarbons (PAHs) downstream of the Tailings Impoundment (MW17-20A) were lower than the previous groundwater sampling events completed in July and October 2017. The groundwater quality in that area has improved since 2017. Natural attenuation seems to be present and concentrations are decreasing with time.

Concentrations observed in 2020 for benzene, toluene, ethylbenzene and xylenes (BTEX) and PAHs at the Main Landfill (APEC 9) (MW17-22A) were lower than the previous groundwater sampling events completed in July and October 2017. The groundwater quality in that area has improved since 2017. Natural attenuation is likely occurring, and concentrations are decreasing with time.

**Background Groundwater Assessment**

The 2017 to 2020 field investigations identified elevated concentrations of dissolved metals: antimony, cobalt, manganese, cadmium, copper, lithium, iron, uranium and arsenic in groundwater. An assessment of background concentrations of dissolved metals has indicated that antimony, arsenic, uranium, iron, lithium, cobalt and manganese are elevated compared to background concentrations and could be attributed to historical mining activities. Wood observed that the concentrations of dissolved metals are generally decreasing over time. When compared to the BC Contaminated Sites Regulation (CSR), many of the dissolved metals concentrations that are elevated are still less than BC Contaminated Site Regulation (CSR) aquatic life (AWF) water use standards. Additionally, many of the observed exceedances were not reproduced during groundwater well resampling events. When taking the CSR into consideration manganese appears to be the remaining dissolved metal that would require further assessment.

Elevated dissolved concentrations of manganese appear to be associated with the AEC 1 – Mill Building and 10 Level Portal; however, elevated manganese was also identified at APEC 10 – Burial Site # 1, APEC 12 – Burial Site # 2 and at AEC 2 – Tank Farm and Fuel Line area. The location where elevated manganese is identified were all in disturbed areas and the highest concentrations were found around the AEC 1 – Mill Building and 10 Level Portal.

**Surface Water Sampling**

Surface water sample SW20-02, located at AEC 1 (Mill – 10 Level Portal), contained a detectable concentration of methylnaphthalene. It has not been determined if the detectable concentration can be related to former activities at AEC 1 or were introduced during laboratory testing. Traces of contaminants are commonly introduced during laboratory testing; however, the concentrations are not considered significant by the laboratory if they are less than a pre-determined limit. Wood recommends to re-sample this location during the next field season for analysis of methylnaphthalene to confirm the detection in surface water.

**Summary of APECs and AECs**

Based on the result of the 2020 SSI, the following APECs/AECs are recommended to be carried forward for additional assessment and/or remediation work.

**Summary of APECs and AECs**

Initial APEC	Description	2019 Classification	Contaminant Type	Potential contaminants of concern (PCOCs) <sup>1</sup>	Contaminants of Concern (COCs) <sup>2</sup>
APEC 1	Mill / 10 Level Portal	AEC 1	Diesel fuel and lubricants	Groundwater: cobalt, manganese	Soil: heavy extractable petroleum hydrocarbons (HEPH)  Groundwater: manganese, acenaphthene, methylnaphthalene, LEPH <sub>w</sub> , extractable petroleum hydrocarbons (EPH <sub>w10-19</sub> )
APEC 2 / APEC 14	Tank Farm Area / Fuel Lines	AEC 2	Diesel fuel, aviation fuels and possibly gasoline, waste rock	Groundwater: manganese	Soil: volatile petroleum hydrocarbons (VPHs), LEPH <sub>s</sub>  Groundwater: Groundwater: manganese, LNAPL, methylnaphthalene and LEPH <sub>w</sub>
APEC 4	Fuel Pump Shed	AEC 3	Diesel fuel and Avgas	-	Soil: LEPH
APEC 5	Mechanical Shop / 11 Level Portal	AEC 4	Fuels, lubricants, and waste rock storage	-	Soil: toluene, xylenes, VPHs, LEPH and HEPH

Initial APEC	Description	2019 Classification	Contaminant Type	Potential contaminants of concern (PCOCs) <sup>1</sup>	Contaminants of Concern (COCs) <sup>2</sup>
APEC 9	Main Landfill	AEC 5	Inferred to be diesel fuel	-	Groundwater: BTEX, LEPHW, methylnaphthalene, naphthalene and metals
APEC 10	Burial Site 1 (Fmr. Chalet)	APEC 10	Waste rock	Groundwater: manganese	Groundwater: manganese
APEC 11	Airstrip	AEC 6	Waste rock	Groundwater: metals	-
APEC 12	Burial Site #2	APEC 12	Contents of burial site, waste rock	Groundwater: manganese	Groundwater: manganese
APEC 13	Warehouse East Area	AEC 7	Stored / used fuel and lubricants	Groundwater: BTEX, LEPHW, naphthalene and metals	Soil: LEPH, HEPH

**Notes:**

- <sup>1</sup> Elevated metal concentrations in soil are expected across the surface of a mine site. Elevated metals in soil may need to be addressed through determining background concentrations or through a risk assessment.
- <sup>2</sup> Note, potentially acid generating (PAG) material is identified in other locations within the mine site; however, those areas have been identified by SnipGold and are scheduled for removal to the tailing storage facility (TSF). This has been included as an APEC due to potential for metals leaching.

## 1.0 Introduction

Wood Environment & Infrastructure Solutions (Wood) was retained by SnipGold Corporation (SnipGold) to complete a Supplementary Site Investigation (SSI) at the Johnny Mountain Mine (JMM) Site to provide supplemental information to support and inform the mine reclamation efforts currently in progress. Site investigation work has been ongoing since 2017 and the following reports were issued: 1) 2017 Site Investigation (2017 SI) report, 2) 2018 Supplementary Site Investigation (SSI) report, and 3) 2019 SSI report. The objective of the 2020 SSI was to 1) determine existing concentrations of petroleum hydrocarbons in the in-situ treatment areas; 2) further evaluate concentrations of metals in groundwater in upstream, midstream and downstream locations, 3) groundwater sampling required to support annual compliance monitoring requirements for Permit PR-7927, and 4) conduct the sampling of surface water samples to acquire data to support an Ecological Risk Assessment (ERA) completed under separate scope and cover.

The in-field portion of the 2020 SSI was conducted in August 2020. The results of the 2017 through 2020 field investigation, laboratory analyses, and data evaluation are provided in this report.

### 1.1 Site Background

A brief discussion of the history of the JMM Site, the Site reclamation activities conducted to date, and the results of previously conducted environmental investigations are provided in the following sections.

#### 1.1.1 Site History

The Johnny Mountain Mine was an underground mine that saw development from 1986 to 1988 with mining/milling beginning in 1988. Mine production included producing gold, silver, and copper concentrate. The mine location is shown on Figure 1 and a Site Plan is shown on Figure 2 (see Appendices). Mining operations were relatively short-lived and occurred from November 1988 to August 1990 and from September to November 1993 when operations were stopped. Mining facilities included three adits (numbered 10, 11, and 12), five vent shafts, a mill building, a tailings facility, an air strip (at the Mine Site), a fuel tank farm, several ancillary buildings, waste rock piles, a 10-km road from the Bronson Camp to the mine, a septic bed, and a few other minor components. The milling process comprised conventional grinding and gravity separation, which initially included a cyanide leach process. Due to inefficiencies, the cyanide leach process ceased during active mining operation.

The Johnny Mountain Mine was owned and operated by International Skyline Gold Corporation (Skyline). During a share roll-back in May 2012, Skyline changed its name to SnipGold Corporation. SnipGold was subsequently acquired by Seabridge Gold in 2016 and currently operates as a subsidiary of Seabridge Gold. SnipGold currently maintains exploration activities on its mineral claims in the area of the Site focusing on the Quartz Rise area.

#### 1.1.2 Pre-2016 Reclamation Activities

Following mine closure, limited reclamation activities began in 1995. A formal Reclamation Plan was prepared in 1999 (Woznow and Yeager, 1999) and approved by the BC Ministry of Energy and Mines in October 15, 1999. Following a period between 2002 through 2008 during which minimal reclamation work was completed, the Site reclamation was progressed in 2009 following a list of prioritized tasks. The history of JMM reclamation during these years can be reviewed in the 2015 annual reclamation report (ARR) (Greenwood 2015).

### 1.1.3 Reclamation Activities Since 2016

Following acquisition of SnipGold and the Johnny Mountain Mine in 2016, SnipGold continued with mine reclamation activities. During their inaugural reclamation season in 2016, SnipGold reviewed the reclamation activities which had been completed to date and developed a five-year Johnny Mountain Mine Project Execution Plan (PEP) that meets the requirements of the approved Closure and Reclamation Plan. The 2016 reclamation activities were focused on the clean-up of the Bronson airstrip area and the engineering evaluation of the road connecting Bronson airstrip with the JMM Site as part of preparation for future reclamation activities, the long-term stability of the tailings dam was examined and a dam safety review (DSR) was conducted in August 2016. A detailed account of Site Reclamation activities up to and including the 2016 field season is provided in the 2016 Annual Reclamation Report (RTEC, 2017).

In the summer of 2017, SnipGold continued reclamation activities at the JMM Site, undertaking the following main activities:

- Investigation of the Site to determine the presence/absence of environmental contamination in areas of environmental concern;
- Mill building clean-up, inspection of and improvements to the TSF;
- Completion of a borrow source investigation program; and
- Demolition of the Tank Farm.

In 2017 Wood completed a Site Investigation (2017 SI) which included the identification and investigation of fourteen (14) areas of potential environmental concern (APECs 1-14) relating to historic mining operations (Amec Foster Wheeler, 2018). The locations of APECs and areas of environmental concern (AECs) are presented on Figures 3 and 4 (see Appendices) and the sampling locations are presented on Figures 5 to 12 (see Appendices). The results of the 2017 SI indicated that there was contamination present related to former operations within six (6) APECs. These APECs were carried forward as areas of environmental concern (AECs). Table 1 below lists the APECs assessed during the 2017 SI.

The 2017 SI results indicated that further investigation work was required at four (4) of the APECs to confirm the presence/absence of contamination.

A follow-up Supplemental Site Investigation SSI was completed in 2018 (2018 SSI) by Wood. At the conclusion of the 2018 SSI there remained six (6) AECs at which contamination was identified as present related to former operations and four (4) APECs where additional assessment work was recommended. Table 1 below lists the APECs assessed during 2018 SSI.

Additionally, in 2018 SnipGold continued reclamation activities at the JMM Site, undertaking the following main activities (by area):

- Construction of Phase 1 (Cell 1) of the Main Landfill;
- Burial Site 1 (APEC 10);
  - Excavation of waste material and placement in Main Landfill. The remediation work was conducted by Northwest Response (Northwest Response, 2018b);
- Burial Site 2 (APEC 12);
  - Excavation of waste material and placement in Main Landfill. The remediation work was conducted by Northwest Response (Northwest Response, 2018b);
- Mill Building (AEC 1);

- Removal of landfillable demolition debris from inside the building and placement in the main landfill;
- Removal of concentrate from within the mill building and placement below water within the tailings impoundment;
- Removed 4000 kg of hazardous material offsite to a certified landfill;
- Initiate demolition of infrastructure at the 10-Level Portal;
- Tank Farm and Fuel Lines (AEC 2);
  - Initiate in-situ remediation of hydrocarbon contaminated soil. The remediation work was conducted by Northwest Response (Northwest Response, 2018a);
  - Removal of demolished tanks and placement in the Main Landfill;
- JMM Airstrip (AEC 6);
  - Mapping of potentially acid generating (PAG) materials that was historically added to the airstrip as surfacing material

In 2019 Wood completed a Supplemental Site Investigation (2019 SSI). The 2019 SSI was completed to further delineate contamination identified by the 2017 Site Investigations (SI) and 2018 SSI conducted by Wood and to conduct further presence/absence investigation in potentially contaminated areas. Also conducted was the investigation into the potential presence of PAG within the airstrip and sampling to determine the efficacy of the 2019 hydrocarbon remediation work.

The objectives of the 2019 SSI included specific tasks to support ongoing Site reclamation work, including:

- Continuing an environmental site investigation of specific areas of AECs and APECs to delineate previously identified hydrocarbon impacts or to assess areas with potential hydrocarbon impacts within the following APECs/AECs:
  - APEC 12 – Burial Site 2;
  - APEC 13 – Warehouse East;
  - APEC 8 – 12 Level Portal;
  - AEC 1 – Mill /10 Level Portal;
  - AEC 2 – Tank Farm and Fuel Lines and AEC 3 – Fuel Pump Shed;
  - AEC 4 – Mechanical Shop / 11-Level Portal;
- Continuing in-situ hydrocarbon remediation of contaminated soil in the area adjacent to the Tank Farm and Fuelling Facilities;
- Evaluation of petroleum hydrocarbon levels in material to be placed in the TSF;
- Continuing evaluation of background concentration of metals in groundwater by completing Site wide additional groundwater monitoring and sampling activities;
- Delineation of PAG material along the Airstrip; and
- Collection of groundwater quality data required to support annual compliance reporting requirements for Permit PR-7927.

The sampling locations of 2019 SSI are presented on Figures 5 to 12 (see Appendices).

Table 1 below lists the APECs assessed during the 2019 SSI and the final classification of the APEC. APECs 2 and 14 were combined into one AEC as they represented a single contaminant plume. The following four APECs were removed from the list :

- APEC 3 and APEC 6 were removed as the 2018 SSI that determined that no further investigation was required; and
- APEC 8 was removed as the 2019 SSI that determined that no further investigation was required.

**Table 1: Summary of APECs and AECs 2017 to 2019**

#	Description	Investigated in 2017	2017 Classification	Investigated in 2018	Investigated in 2019	2019 Classification
APEC 1	Mill / 10 Level Portal	Yes	AEC 1	Yes	Yes	AEC 1
APEC 2 / APEC 14	Tank Farm Area / Fuel Lines <sup>1</sup>	Yes	AEC 2	Yes	Yes	AEC 2
APEC 3	Main Warehouses	Yes	<b>Removed</b>

APEC 11	Airstrip	Yes	AEC 6	Yes	No	AEC 6
APEC 12	Burial Site 2	Yes	APEC 12	No	Yes	APEC 12
APEC 13	Warehouse East Area	Yes	APEC 13	No	Yes	AEC 7

In 2020 Wood prepared a draft ERA for the JMM Site. The draft ERA was prepared to quantitatively assess the potential risks to ecological receptors associated with exposure to potential contaminants of concern (PCOC) in various media (e.g., soil, groundwater). This information will be used to identify risk-based closure criteria for elevated dissolved metals in groundwater and elevated petroleum hydrocarbons in soil and groundwater. The draft ERA was also prepared to identify AECs where SnipGold should focus their reclamation efforts based on potential risk identified to ecological receptors.

## 2.0 Objectives

At the conclusion of the 2019 SSI an APEC/AEC list and their associated PCOC/COCs was prepared. This list formed the basis of the 2020 objectives. The 2019 APEC/AEC list is presented in Table 2.

**Table 2: Summary of APECs/AECs and Associated PCOCs/COCs After 2019**

2019 Classification	Contaminant Type)	PCOCs <sup>1</sup>	COCs <sup>2</sup>	Summary of 2019 Recommendations
AEC 1 – Mill / 10 Level Portal	Diesel fuel and lubricants	Groundwater: cobalt, manganese	Soil: Heavy extractable petroleum hydrocarbons (HEPH)  Groundwater: Light extractable petroleum hydrocarbons (LEPH <sub>w</sub> ), Extractable petroleum hydrocarbons (EPH <sub>w10-19</sub> )	Groundwater sampling  HC remediation of soil
AEC 2 – Tank Farm and Fuel Lines	Diesel fuel, aviation fuels and possibly gasoline, waste rock	Groundwater: manganese	Soil: VPH <sub>s</sub> , LEPH <sub>s</sub>  Groundwater: LEPH <sub>w</sub>	Groundwater sampling  HC remediation of soil
AEC 3 – Fuel Pump Shed	Diesel fuel and Avgas	-	Soil: LEPH	HC remediation of soil
AEC 4 – Mechanical Shop / 11 Level Portal	Fuels, lubricants, and waste rock storage	-	Soil: toluene, xylenes, VPH <sub>s</sub> , LEPH and HEPH	HC remediation of soil
AEC 5 – Main Landfill	Inferred to be diesel fuel	-	Groundwater: benzene, toluene, ethylbenzene and xylenes (BTEX,) LEPH <sub>w</sub> , methylnaphthalene, naphthalene and metals	Groundwater sampling
APEC 10 - Burial Site #1 (Fmr. Chalet)	Waste rock	Groundwater: manganese	-	Groundwater sampling

2019 Classification	Contaminant Type)	PCOCs <sup>1</sup>	COCs <sup>2</sup>	Summary of 2019 Recommendations
AEC 6 – JMM Airstrip	Waste rock	Groundwater: metals	-	Groundwater sampling
APEC 12 - Burial Site #2	Contents of burial site, waste rock	Groundwater: manganese	-	Groundwater sampling
AEC 7 – Warehouse Area East	Stored / used fuel and lubricants	Groundwater: BTEX, LEPH <sub>w</sub> , naphthalene and metals	Soil: LEPH, HEPH	Groundwater sampling Additional soil sampling
APEC 7 - Tailings Impoundment	Tailing Storage Facility (TSF)	Groundwater: metals	-	Groundwater sampling

**Notes:**

APEC = area of potential environmental concern

AEC = area of environmental concern

BTEX = benzene, toluene, ethylbenzene and xylene

COCs = contaminants of concern

HEPH = heavy extractable petroleum hydrocarbons

LEPH<sub>s</sub> = light extractable petroleum hydrocarbons in soil

LEPH<sub>w</sub> = light extractable petroleum hydrocarbons in water

VPH<sub>s</sub> = volatile petroleum hydrocarbons in soil

EPH<sub>w10-19</sub> = extractable petroleum hydrocarbons in water (C10 – C19)

<sup>1</sup> Elevated metal concentrations in soil are expected across the surface of a mine site. Elevated metals in soil may need to be addressed through determining background concentrations or through a risk assessment.

<sup>2</sup> Note that PAG material is identified in other locations within the mine site; however, those areas have been identified by SnipGold and are scheduled for removal to the TSF. This has been included as an APEC due to potential for metals leaching.

In 2020, to limit exposure from outbreak of the Covid-19 virus, heavy equipment was not available at the Site. The scope was modified as test pitting with an excavator could not be completed. Additionally, excavation of hydrocarbon contaminated soil for further soil remediation or mechanical aeration of treatment areas could not be completed in 2020. The modified 2020 objectives to support ongoing Site reclamation work included:

- Continue an environmental site investigation of specific AECs and APECs to assess hydrocarbon impacts in groundwater within the following APECs/AECs were prioritized:
  - AEC 1: Mill/10 Level Portal;
  - AEC 2: Tank Farm and Fuel Lines and AEC 3 – Fuel Pump Shed;
  - AEC 5: Main Landfill; and
  - Tailings storage facility (TSF).
- Evaluation of petroleum hydrocarbon levels in material located in the Treatment Areas 1 and 2 by hand digging test pits into the material;

- Continuing evaluation of background concentration of metals in groundwater by completing additional groundwater monitoring and sampling activities;
- Collection of surface water samples at strategic locations to support the ERA; and
- Collection of groundwater quality data at the Main Landfill, required to support annual compliance reporting requirements for Permit PR-7927.

### 3.0 Scope of Work

The scope of work for the 2020 SSI was outlined in the proposal document titled “*Jonny Mountain Mine Reclamation Plan 2020 Scope of Work: Remediation of Hydrocarbons in Soil, Environmental Investigation, and Landfill Design and Construction Services*”, dated January 25, 2020 (Rev1). The scope of work was subsequently modified as heavy equipment was not available for the 2020 field season. The modified scope of work included the following tasks:

#### 3.1 In-Situ Hydrocarbon Remediation

SnipGold has undertaken the physical remediation of hydrocarbons in soil within AEC 2 – Tank Farm and Fuel Line area. Remediation of petroleum hydrocarbon soil contamination in the area of the Fuel Tank Farm and Fuel Lines (AEC 2) was commenced by NorthWest Response during the 2018 and 2019 field season. As a result of the remediation program, there is a stockpile of soil excavated in 2018 that contains approximately 3,000 m<sup>3</sup> of soil, hereafter referred to as Treatment Area 1 (see Figure 7). Treatment Area 1 is located in the Fuel Line area portion of AEC 2 (see Figure 7). In 2019 an additional 6,000 m<sup>3</sup> of soil was excavated in 2019 from AEC 2 and placed into a stockpile, hereafter referred to as Treatment Area 2. Treatment Area 2 is located in the former Tank Farm portion of AEC 2.

Wood’s 2020 scope of work included the completion of year-end sampling of Treatment Area 1 and Treatment Area 2. The treated soil was evaluated for petroleum hydrocarbon constituents, nutrients, moisture content, pH and hydrocarbon utilizing bacteria (HUB). The assessment of the efficacy of the remediation program was also included within the 2020 scope of work.

#### 3.2 Groundwater Sampling Program - Hydrocarbons

The 2017 to 2019 field investigations identified elevated concentrations of dissolved hydrocarbons in groundwater wells MW17-04B, MW17-13, MW17-20A, MW17-22A and MW17-23A. To assess current concentrations and the fate of dissolved hydrocarbons in groundwater over time, the following wells were proposed to be sampled for benzene, toluene, ethylbenzene and xylenes (BTEX), light and heavy extractable petroleum hydrocarbons (LEPH<sub>w</sub>/HEPH<sub>w</sub>) and polycyclic aromatic hydrocarbons in water (PAH<sub>w</sub>) and some selected wells on volatile hydrocarbons (VH<sub>w</sub>) and volatile petroleum hydrocarbons (VPH<sub>w</sub>):

- AEC 1 – Mill /10 Level Portal: MW17-04A, MW17-04B, MW17-06A, MW17-06B, MW17-07A, MW17-07B
- AEC 2 – Tank Farm and Fuel Lines: MW17-12A, MW17-12B, MW17-13, MW17-17A, MW17-17B
- AEC 5 - Main Landfill: MW17-22A, MW17-22B.
- APEC 7 -TSF: MW17-20A, MW17-20B and MW17-23A.

The rationale for the completion of groundwater sampling on these wells is presented in Table 3 in Section 4.4. The location of those wells is presented on Figures 5 through 12 appended to this report.

### 3.3 Background Groundwater Assessment

The Site investigation work completed by Wood during the 2017 to 2019 field seasons identified elevated concentrations of dissolved metals: cobalt, manganese, cadmium, copper and arsenic in groundwater. Wood completed a background groundwater assessment using available data supplemented with additional groundwater sampling completed in 2019. By using the information obtained during the 2017 to 2020 field sampling programs, Wood completed the following:

- Updated the 2019 dataset to demonstrate background groundwater quality. Background concentrations can be used for a direct comparison to groundwater quality data from within APECs and AECs;
- Complete a trend analysis of specific water quality parameters to assess if dissolved metals concentrations vary significantly over time in a manner indicative of the presence of a contaminant source; and
- Complete graphical analyses of the expanded groundwater quality dataset to identify groundwater geochemical anomalies along inferred groundwater flow paths. A statistical evaluation of outliers was completed using various outlier tests.

The rationale for the completion of groundwater sampling for background dissolved metals is presented in Table 3 in Section 4.4.

### 3.4 2020 Landfill Compliance Sampling

Permit PR-7927 authorizes the discharge of waste to the Main Landfill and includes conditions requiring annual groundwater monitoring for a period of five years starting in the summer of 2018. The permit requires annual groundwater sampling be conducted at groundwater monitoring wells MW17-22A and MW17-22B during summer months. Part of the 2020 scope of work for Wood was to ensure that groundwater samples were collected from MW17-22A and MW17-22B in compliance with permit PR-7927.

### 3.5 2020 Surface Water Sampling

The ERA being prepared by Wood in 2019 recommended collection of surface water samples at strategic locations across the Site, particularly upstream to establish background concentrations and to determine concentrations at select compliance points. To assess current concentrations in surface water, the following locations were sampled:

- Camp Creek (South of AEC 2: Tank Farm and Fuel Lines) (SW20-01);
- Unnamed stream located at AEC 1: Mill -10 Level Portal (East of the mill building) (SW20-02); and
- Stonehouse Creek (South of 12 Level Portal) (SW20-03).

## 4.0 2020 Investigation Methodology

The methodologies used to conduct the individual tasks as part of the overall 2020 scope of work are discussed in the following sections and include detailed discussions of:

- In-situ hydrocarbon stockpile sampling in remediation areas;
- Soil field screening;
- Surface water Sampling;
- Groundwater monitoring wells sampling; and

- Quality assurance and quality control.

#### 4.1 In-Situ Hydrocarbon Remediation Area Sampling

SnipGold has undertaken the physical remediation of hydrocarbons in soil within AEC 2 – Tank Farm and Fuel Line area. Remediation of petroleum hydrocarbon soil contamination in the area of the Fuel Tank Farm and Fuel Lines (AEC 2) was commenced by NorthWest Response during the 2018 and 2019 field season. As a result of the remediation program, there is a stockpile of soil excavated in 2018 that contains approximately 3,000 m<sup>3</sup> of soil, hereafter referred to as Treatment Area 1. Treatment Area 1 is located in the Fuel Line area portion of AEC 2. There is also an additional 6,000 m<sup>3</sup> of soil that was excavated in 2019 from AEC 2 and placed into a stockpile, hereafter referred to as Treatment Area 2. Treatment Area 2 is located in the former Tank Farm portion of AEC 2. Within these treatment areas, a total of 9,000 m<sup>3</sup> of soil was treated during the 2018 and 2019 reclamation season. The approximate locations of the treatment areas are presented on Figure 7 (see Appendices).

On August 29 2020, Wood completed six hand dug test pits (TP20-1-1 to TP20-1-6) until a depth of 1 metre below ground level (mbgl) within Treatment Area 1 and twelve test pits (TP20-2-1 to TP20-2-12) until a depth of 1 mbgl within Treatment Area 2 to assess hydrocarbon concentrations in soil. One sample was collected from each test pit, and two duplicate soil samples were obtained from each treatment area.

#### 4.2 Soil Sampling

A new pair of nitrile gloves was worn for the collection of each of the soil samples. Each soil sample was split with a portion of the sample placed into laboratory supplied containers for laboratory analysis, and the remaining sample was placed into a plastic bag for field screening. The laboratory-supplied containers were specific to the analysis requested. This included the use of methanol vials for containing samples submitted for analysis on volatile organic compound (VOC) parameters.

All soil samples collected for VOCs were field-screened for sample headspace vapours using the ambient temperature headspace technique and an RKI Eagle 2PID in methane elimination mode. The RKI Eagle 2 was calibrated at the start of each workday using hexane. Additionally, each soil sample was visually examined for indicators of potential contamination (e.g., staining, discoloration and debris inclusions) and to classify the soil type in accordance with the Unified Soil Classification System (USCS) based on applicable ASTM International standards (2011). Although not part of the screening procedure, olfactory indicators of contamination were recorded among the field observations.

Each sample jar and vial to be submitted for laboratory analysis was labelled with a unique sample number, registered on a chain of custody form, and stored in a cooler with ice packs before transport to the laboratory. Sufficient ice packs were placed within the coolers to maintain (as close as possible) a temperature of 4°C for the period of transport. Samples were couriered to ALS in Burnaby, BC.

#### 4.3 Soil Field Screening

Soil field screening was completed on site by Wood field staff. Each soil sample was visually examined and physically classified in accordance with the modified Unified Soil Classification System (USCS). The grab samples were also examined for indicators of hydrocarbon contamination (e.g. black staining and hydrocarbon odour).

#### 4.4 Groundwater Monitoring and Sampling

The location of the monitoring wells is presented on Figures 5 to 12 (see Appendices). Groundwater samples were submitted for laboratory analysis of dissolved metals, ions and nutrients, and some samples on BTEX<sub>w</sub>, LEPH<sub>w</sub>/HEPH<sub>w</sub>, PAH<sub>w</sub>, VHW and VPH<sub>w</sub>. The rationale for the completion of groundwater sampling on these wells is presented in the table below.

**Table 3: Rationale for Groundwater Sampling**

Monitoring Well ID	Sampling Period	Area	Rationale for Analysis
MW17-04A	August 23, 2020	AEC 1: Mill / 10 Level Portal	Determine the current concentrations of hydrocarbons in groundwater in the Mill Building Area.
MW17-04B	August 23, 2020	AEC 1: Mill / 10 Level Portal Midstream	Confirm repeatability of dissolved manganese observed in 2019 in groundwater in the Mill Building Area  Confirm the current concentrations of hydrocarbons in groundwater in the Mill Building Area.
MW17-05B	August 23, 2020	AEC 1: Mill / 10 Level Portal Midstream	Confirm repeatability of dissolved cobalt and manganese observed in 2019 in groundwater in the Mill Building Area
MW17-06A	August 23, 2020	AEC 1: Mill / 10 Level Portal	Determine the current concentrations of hydrocarbons in groundwater in the Mill Building Area.
MW17-06B	August 23, 2020	AEC 1: Mill / 10 Level Portal Midstream	Confirm repeatability of dissolved manganese observed in 2019 in groundwater in the Mill Building Area.  Determine the current concentrations of hydrocarbons in groundwater in the Mill Building Area.
MW17-07A	August 23, 2020	AEC 1: Mill / 10 Level Portal	Determine the current concentrations of hydrocarbons in groundwater in the Mill Building Area.
MW17-07B	August 23, 2020	AEC 1: Mill / 10 Level Portal	Determine the current concentrations of hydrocarbons in groundwater in the Mill Building Area.
MW17-09A	August 28, 2020	APEC 10: Burial Site 1 Midstream	Confirm repeatability of dissolved lithium and uranium observed in 2019 in this area.
MW17-09B	August 28, 2020	APEC 10: Burial Site 1 Midstream	Confirm repeatability of dissolved cobalt, and manganese observed in 2019 in this area.
MW17-11A	August 24, 2020	Stonehouse Creek Drainage Downstream	Confirm the current concentrations of dissolved metals in that area.

Monitoring Well ID	Sampling Period	Area	Rationale for Analysis
MW17-11B	August 24, 2020	Stonehouse Creek Downstream	Confirm the current concentrations of dissolved metals in that area.
MW17-12A	August 24, 2020	AEC 2: Fuel Lines	Determine the current concentrations of hydrocarbons in groundwater in the Fuel Lines area.
MW17-12B	August 24, 2020	AEC 2: Fuel Lines	Determine the current concentrations of hydrocarbons in groundwater in the Fuel Lines area.
MW17-14A	August 25, 2020	Midstream	Confirm the current concentrations of dissolved metals in that area.
MW17-17A	August 24, 2020	AEC 2: Tank Farm and Fuel Lines	Determine the current concentrations of hydrocarbons in groundwater in the Tank Farm and Fuel Lines area.
MW17-17B *	August 24, 2020	AEC 2: Tank Farm and Fuel Lines	Determine the current concentrations of hydrocarbons in groundwater in the Tank Farm and Fuel Lines area.
MW17-20A	August 25, 2020	TSF	Determine the current concentrations of hydrocarbons in groundwater in the TSF area.
MW17-20B	August 25, 2020	TSF	Determine the current concentrations of hydrocarbons in groundwater in the TSF area.
MW17-21A	August 25, 2020	Sky Creek Drainage Upstream	Confirm the current concentrations of dissolved metals in that area.
MW17-21B	August 25, 2020	Sky Creek Drainage Upstream	Confirm the current concentrations of dissolved metals in that area.
MW17-22A	August 28, 2020	AEC 5 : Main Landfill Landfill Downstream	Landfill compliance monitoring. Confirm the current concentrations of dissolved metals in that area.
MW17-22B	August 28, 2020	AEC 5 : Main Landfill Landfill Downstream	Landfill compliance monitoring. Confirm the current concentrations of dissolved metals in that area.
MW17-23A	August 28, 2020	TSF	Determine the current concentrations of dissolved hydrocarbons in groundwater in this area.
MW17-24A	August 24, 2020	Sky Creek Drainage Downstream	Confirm the current concentrations of dissolved metals in that area.
MW17-24B	August 24, 2020	Sky Creek Drainage Downstream	Confirm the current concentrations of dissolved metals in that area.

Monitoring Well ID	Sampling Period	Area	Rationale for Analysis
MW17-25A	August 24, 2020	TSF	Confirm the current concentrations of dissolved metals in that area.
MW17-26A	August 25, 2020	Johnny Creek Drainage Upstream	Confirm the current concentrations of dissolved metals in that area.
MW17-26B	August 24, 2020	Johnny Creek Drainage Upstream	Confirm the current concentrations of dissolved metals in that area.
MW17-27A	August 28, 2020	AEC 6: Airstrip Upstream	Confirm the current concentrations of dissolved metals in that area.
MW17-27B **	August 28, 2020	AEC 6: Airstrip Upstream	Confirm the current concentrations of dissolved cobalt observed in 2019 in that area.

\* Monitoring well MW17-17B was not sampled as a LNAPL was detected in that well.

\*\* Monitoring well MW17-27B was not sampled as the field technician was not able to purge that well (due to the presence of sand and sediments in the well).

On August 23, 24, 25 and 28 2020, Wood collected groundwater samples from the monitoring wells listed in Table 3 (except for wells MW17-17B and MW17-27B).

Monitoring wells MW17-22A and MW17-22B, located downgradient from the landfill, were sampled to satisfy the requirements for permit PR-7927, which authorizes the discharge of waste to the Main Landfill. The location of monitoring wells MW17-22A and MW17-22B are presented on Figure 12 (see Appendices). Groundwater samples collected from monitoring wells MW17-22A and MW17-22B were submitted for analysis of BTEX, EPHw<sub>10-19</sub>, PAHs, ion and nutrients (alkalinity, bicarbonate, carbonate, chloride, fluoride, hydroxide, nitrate, nitrite, ammonia, total potassium, total sodium, sulphate), total and dissolved metals, chemical oxygen demand (COD), cyanide, cyanate and thiocyanate, total inorganic carbon (TIC), total organic carbon (TOC), total dissolved solids (TDS), electrical conductivity (EC), hardness.

All groundwater sampling was conducted using a low-flow sampling technique as defined in ASTM Standard D4448-01 (ASTM, 2013) and consistent with the BC Ministry of Environment and Climate Change Strategy (ENV) water monitoring guidance for mines (BC MOE 2016) for groundwater wells less than 10 m in depth. For groundwater wells greater than 10 m in depth, Waterra tubing was used to purge the well. Before purging each well, the depth to water was recorded. The depth measurements were consistently recorded from the mark on top of the polyvinyl chloride (PVC) standpipe.

During purging at each monitoring well, a YSI Professional Plus multi-meter was used to measure physicochemical parameters of the purge water to determine when the measured parameters stabilized between readings. At the point at which the monitored physicochemical parameters had stabilized, the groundwater passing through the flow through cell was considered to be representative of formation water, and sample collection was commenced. The following parameter stabilization targets (parameter stabilization) were used during purging:

- pH ±0.1 units;
- temperature ±0.2 °C;
- electrical conductivity (EC) ±3%;

- oxidation/reduction potential (ORP)  $\pm 10$  mV; and
- dissolved oxygen (DO)  $\pm 10\%$ .

A groundwater sample was deemed representative of formation water if groundwater purging targets were met.

Each sample was collected in laboratory supplied containers by field personnel wearing nitrile gloves. Each sample was preserved with allocated preservatives supplied by the laboratory. Each sample container was labelled with a unique sample number, registered on a chain of custody form, and stored in a cooler with ice packs before transport to the laboratory. Sufficient ice packs were packed within the coolers to maintain (as close as possible) a temperature of 4°C for the period of transport. Samples were couriered to ALS in Burnaby, BC.

Blind duplicate samples were collected by filling the primary and duplicate sample containers simultaneously. The duplicate samples were labelled such that their duplicate pairs could not be identified by the sample name alone.

#### 4.5 Quality Assurance / Quality Control

The Quality Assurance / Quality Control (QA/QC) plan addresses analysis and the sample quality from collection to reporting. The methodology is detailed in the British Columbia Environmental Laboratory Manual, 2015 Edition (BC MOE, 2015b).

The QA program consisted of the following components:

- Each sample was collected using the same methodology;
- Sample containers were labelled with the sampling date, the project number, and the individual sample number;
- Sampler used new nitrile disposable gloves during the collection of each sample;
- Samples were stored and delivered to the laboratory in chilled insulated coolers where they arrived at the proper temperature;
- Samples were shipped under chain of custody protocols from Johnny Mountain Mine to ALS Laboratory in Terrace by Wood field staff. Samples were then transferred from ALS Laboratory Terrace to ALS Laboratory in Burnaby;
- Samples were analyzed by a laboratory accredited by the Canadian Association for Laboratory Accreditation (CALA);
- A review was conducted of data tables with original analytical records; and
- The analytical laboratory confirms that their quality assurance conforms to the British Columbia Environmental Laboratory Manual, 2015 Edition.

The QA program included procedures implemented in the field and laboratory to demonstrate the generated data were reliable.

As part of the QC program, a blind duplicate was analyzed for all parameters to verify sampling and analytical reproducibility. The respective relative percent differences (RPD) were calculated. Duplicate sample results were compared to primary sample results to flag any variations with laboratory experimental procedures. RPD is the difference in concentration between the primary and duplicate results divided by the average concentration of the primary and duplicate results. RPDs are only applied when the measured concentrations are at least five times the Method Detection Limit (MDL), which is

commonly referred to as the Practical Quantitation Limit (PQL). Error is known to increase within five times the MDL, and RPDs are generally not considered to be valid measures of sample variability at these low concentrations. The RPD calculations and concentrations are summarized in Tables 2 to 7 and 9 to 14 (in Appendices). The RPD levels used for evaluation of data quality were those identified in the British Columbia Field Sampling Manual (BC MOE, 2013).

## 5.0 Investigation Results

The results of the individual tests, laboratory analyses, and data evaluations are discussed in the following sections. The results as they pertain to the specific objectives of the 2020 SSI are discussed under Section 6.0, and the conclusions on an individual APEC/AEC basis are discussed under Section 7.0.

### 5.1 Soil Field Screening Observations

Soil samples collected during the investigation were field screened for indicators of potential contamination including visual evidence of staining and presence of free petroleum hydrocarbon product. Indirect observations of odour were also recorded where noted. A description of the soil types and USCS classification was recorded.

The soil type encountered during hand dug test pits within Treatment Areas 1 and 2 was consistent with that observed during the 2017, 2018 and 2019 works and included a variable clay/silt/sand/gravel fill.

Hydrocarbon odour was observed during test pitting for sample SP20-02-02 in Treatment Area 2. No odour was observed for all the other samples at Treatment Areas 1 and 2.

### 5.2 Groundwater Monitoring

During the 2017 SI, monitoring wells were drilled in nested pairs such that the well designated as A had a screen set within competent bedrock while the well designated as B had screen either within the weathered shallow bedrock or straddling the bedrock-aternary sediment interface. Generally, nested well pairs were completed within 3 m of each other and were never completed within the same borehole.

One groundwater level monitoring event was performed during August 2020. The depth to groundwater at 30 monitoring wells was recorded using a calibrated electric sounder and was measured from a surveyed reference point at the top of each PVC standpipe ("top of pipe" - TOP). Results of groundwater level surveys are summarized in Table 1 (see Appendices).

Depths to groundwater ranged from artesian conditions at MW17-11A (>1,047.4 masl) to 15.80 m below TOP (1,049.68 masl) at MW17-27A.

### 5.3 Soil Analytical Results – Petroleum Hydrocarbons

The results of the soil laboratory analysis are discussed in the following sections. The results of laboratory analyses are provided in Tables 2 through 8 (see Appendices). The analytical laboratory certificates are included in Appendix B for reference.

It should be noted that for the purpose of this investigation, the soil analytical results for EPH<sub>10-19</sub> are considered equivalent to LEPH and the soil analytical results for EPH<sub>19-32</sub> are considered equivalent to HEPH. LEPH and HEPH are calculated by subtracting PAHs from the EPH<sub>10-19</sub> and EPH<sub>19-32</sub> result, respectively. By calculating the LEPH and HEPH concentrations this way the EPH<sub>10-19</sub> and EPH<sub>19-32</sub> concentrations will always be greater than or equal to the LEPH/HEPH concentrations. This fact allows the use of the EPH<sub>10-19</sub>/EPH<sub>19-32</sub> concentrations for screening for elevated LEPH/HEPH.

### 5.3.1 Treatment Area 1 Year End Sampling –August 29, 2020

#### Petroleum Hydrocarbons

In total, six (6) soil samples (SP20-01-01 to SP20-01-06) and one blind duplicate soil sample (SP20-01-56) were collected from Treatment Area 1 and submitted to ALS for analyses of BTEX, LEPH/HEPHs, VOCs and PAHs. A synopsis of the analytical results is as follows:

- Soil sample SP20-01-05 contained an elevated concentration of LEPH of 1,330 mg/kg;

Soil samples SP20-01-01 and SP20-01-04 contained detectable concentrations of LEPH and HEPH that are less than five times the MDL and are not considered a significant result.

#### Soil Amendments

Three (3) soil samples (SP20-01-01, SP20-01-03 and SP20-01-05) out of six (6) soil samples collected during the 2020 year end sampling of Treatment Area 1 were submitted to ALS for analysis soil moisture, available nitrogen as nitrate and phosphorus as phosphate, HUB and TOC. A synopsis of the analytical results is as follows:

- The soil moisture measured in soil samples collected from Treatment Area 1 ranged between 9.95% and 15%. The ideal moisture content for coarse grained soils encountered at the Site is between 12% and 30% <sup>1</sup>;
- The TOC measured in soil samples collected from Treatment Area 1 ranged between 0.32% and 1.34%;
- The available nitrogen as nitrate concentrations measured in soil samples collected from Treatment Area 1 were below the detection limit of 1 mg/kg.
- The available phosphorus as phosphate concentrations measured in soil samples collected from Treatment Area 1 ranged from <2.0 mg/kg to 4.7 mg/kg.
- The HUB count measured in soil samples from Treatment Area 1 ranged between 20,500 colony forming units per gram (CFU/g) and 56,000 CFU/g. A concentration of less than 3,000 CFU/g is an indicator of stress being placed on the microbial population <sup>2</sup>.

### 5.3.2 Treatment Area 2 Year End Sampling – August 29, 2020

#### Petroleum Hydrocarbons

In total, twelve (12) soil samples (SP20-02-01 to SP20-02-12) and one blind duplicate soil sample (SP20-02-62) were collected from Treatment Area 2 and submitted to ALS for analyses of BTEX and LEPH/HEPHs. A synopsis of the analytical results is as follows:

- Soil sample SP20-02-03 contained an elevated concentration of LEPH of 1,200 mg/kg;
- Soil sample SP20-02-05 contained an elevated concentration of LEPH of 1,050 mg/kg;
- Soil sample SP20-02-06 contained an elevated concentration of LEPH of 1,660 mg/kg;
- Soil sample SP20-02-10 contained an elevated concentration of LEPH of 1,040 mg/kg;

<sup>1</sup> Hydrocarbon Remediation Plan for Johnny Mountain Mine, British Columbia, April 2019, Wood.

<sup>2</sup> US EPA document 510-B-17-003.

Soil samples SP20-02-02, SP20-02-04, SP20-02-07, SP20-02-08 and SP20-02-11 contained detectable concentrations of LEPH and HEPH that are less than five times the MDL and are not considered significant results.

### Soil Amendments

Six (6) soil samples (SP20-02-02, SP20-02-04, SP20-02-06, SP20-02-08, SP20-02-10 and SP20-02-12) out of twelve (12) soil samples collected during the 2020 year end sampling of Treatment Area 2 were submitted to ALS for analysis soil moisture, available nitrogen as nitrate and phosphorus as phosphate, HUB and TOC. A synopsis of the analytical results is as follows:

- The soil moisture measured in samples collected from Treatment Area 2 ranged between 9.63% and 17.2%. Overall, this is within the optimal moisture content range of 12% and 30%;
- The TOC measured in soil samples collected from Treatment Area 1 ranged from 0.19% to 0.50%;
- The available nitrogen as nitrate concentrations measured in soil samples collected from Treatment Area 2 range from <1 mg/kg (three out of six samples) to 15.8 mg/kg.
- The available phosphorus as phosphate concentrations measured in soil samples collected from Treatment Area 2 ranged from <2.0 mg/kg (three out of six samples) to 5 mg/kg.
- The HUB count measured in soil samples from Treatment Area 1 ranged from 6,600 CFU/g to 1,000,000 CFU/g. A concentration of less than 3,000 CFU/g is an indicator of stress being placed on the microbial population <sup>3</sup>.

## 5.4 Groundwater Analytical Results

The results of the groundwater laboratory analysis are discussed in the following sections. The results of laboratory analyses are provided in Tables 9 through 14 and 15B through 15I (see Appendices). The analytical laboratory certificates are included in Appendix B for reference.

For discussion purpose only, when a parameter is considered elevated it exceeded 5 times the laboratory method detection limit (MDL).

### 5.4.1 Petroleum Hydrocarbons Results

Groundwater samples collected from monitoring wells MW17-04A, MW17-04B, MW17-06A, MW17-06B, MW17-07A, MW17-07B, MW17-12A, MW17-12B, MW17-13, MW17-17A, MW17-22A, MW17-22B, MW17-20A, MW17-20B and MW17-23A were submitted for analysis of BTEX, PAHs and LEPH/LEPHs.

Groundwater sample MW17-17A was also submitted for analysis on VPHs and samples MW17-22A and MW17-22B were also submitted for analysis VOCs. No sample was collected from monitoring well MW17-17B as a LNAPL was detected.

A synopsis of the analytical results is as follows:

- Groundwater sample MW17-4B, located within APEC 1 (Mill and 10 Level Portal), contained elevated concentrations of methylnaphthalene and LEPH<sub>w</sub>.
- Groundwater sample MW17-6B, located within APEC 1 (Mill and 10 Level Portal), contained elevated concentrations of acenaphthene and methylnaphthalene;

<sup>3</sup> US EPA document 510-B-17-003.

- Groundwater sample MW17-12A, located within APEC 14 (Fuel Lines), contained an elevated concentration of  $LEPH_w$ .
- Groundwater sample MW17-17A, located within APEC 14 (Fuel Lines), contained an elevated concentration of methylnaphthalene.
- Groundwater sample MW17-20A, located downstream of the Tailings Impoundment, contained elevated concentrations of methylnaphthalene and naphthalene.
- Groundwater samples collected from monitoring well MW17-22A, located at the Main Landfill, contained elevated concentrations of ethylbenzene, methylnaphthalene and naphthalene.
- A light non-aqueous phase liquid (LNAPL) (measurement of 1 cm) was measured with a Heron interface probe within monitoring well MW17-17B located within APEC 14 (Fuel Lines). The presence of LNAPL was also verified visually with a bailer.

### 5.4.2 Dissolved Metals Results

During August 2020, Wood collected groundwater samples from monitoring wells MW17-04B, MW17-05B, MW17-06B, MW17-09A, MW17-09B, MW17-11A, MW17-11B, MW17-21A, MW17-21B, MW17-14A, MW17-24A, MW17-24B, MW17-22A, MW17-22B, MW17-25A, MW17-26A, MW17-26B and MW17-27A. Groundwater samples were submitted for laboratory analysis of dissolved metals. A synopsis of the analytical results is as follows:

- Groundwater sample MW17-5B, located within APEC 1 (Mill and 10 Level Portal), contained elevated concentrations of cobalt (1.94  $\mu\text{g/L}$ ) and manganese (5,700  $\mu\text{g/L}$ );
- Groundwater sample MW17-9A, located within APEC 10 (Burial Site 1), contained an elevated concentration of iron (1,970  $\mu\text{g/L}$ ), lithium (8.5  $\mu\text{g/L}$ ) and manganese (1,760  $\mu\text{g/L}$ );
- Groundwater sample MW17-9B, located within APEC 10 (Burial Site 1), contained elevated concentrations of cobalt (2.96  $\mu\text{g/L}$ ) and manganese (3,320  $\mu\text{g/L}$ );
- Groundwater sample MW17-14A, located within APEC 12 (Burial Site 2), contained an elevated concentration of iron (3,800  $\mu\text{g/L}$ ).
- Groundwater sample MW17-27A, located within APEC 11 (Airstrip), contained elevated concentrations of cobalt (1.44  $\mu\text{g/L}$ );
- Groundwater sample MW17-24A, located downstream Sky Creek Drainage, contained an elevated concentration of Lithium (8.4  $\mu\text{g/L}$ ).
- Groundwater sample MW17-21A, located downstream Sky Creek Drainage, contained an elevated concentration of Lithium (8.5  $\mu\text{g/L}$ ).

All remaining groundwater samples analyzed for dissolved metals reported concentrations that are below the detection limits, less than five times the MDL and/or marginal and not considered significant.

### 5.4.3 Alkalinity, Ions and Nutrients

During August 2020, Wood collected groundwater samples from monitoring wells MW17-04B, MW17-05B, MW17-06B, MW17-09A, MW17-09B, MW17-11A, MW17-11B, MW17-21A, MW17-21B, MW17-14A, MW17-24A, MW17-24B, MW17-22A, MW17-22B, MW17-25A, MW17-26A, MW17-26B and MW17-27A. Groundwater samples were submitted for laboratory analysis of alkalinity, ions and nutrients. All groundwater samples analyzed for alkalinity, ions and nutrients reported concentrations that are consistent with former sampling events, are below the detection limits, less than five times the MDL and/or marginal and not considered significant.

## 5.5 Surface Water Analytical Results

The results of the surface water laboratory analysis are discussed in the following sections. The results of laboratory analyses are provided in Tables 16A through 16D (see Appendices). The analytical laboratory certificates are included in Appendix D for reference.

### 5.5.1 Petroleum Hydrocarbons, PAHs and VOCs Results

Surface water samples SW20-02 and SW20-03 collected from respectively an unnamed stream (AEC 1: Mill – 10 Level Portal) and Stonehouse Creek (South of 12 Level Portal) were submitted for analysis of BTEXw, PAHw, LEPHw/LEPHw and VOCw.

A synopsis of the analytical results is as follows:

- Surface water sample SW20-02 located at AEC 1 (Mill – 10 Level Portal) contained a detectable concentration of methyl-naphthalene, however, the reported results are less than five times the method detection limit (MDL).

All remaining groundwater samples analyzed for BTEXw, PAHw, LEPHw/LEPHw and VOCw reported concentrations that are below the detection limits.

### 5.5.2 Dissolved Metals Results

Surface water samples SW20-01 collected from Camp Creek (South of AEC 2: Tank Farm and Fuel Lines) was submitted for analysis of total cadmium, iron, and magnesium, and SW20-02 collected from an unnamed stream (AEC 1: Mill – 10 Level Portal) was submitted for analysis of total manganese.

## 5.6 Quality Assurance and Quality Control Results

To ensure quality of data, a field duplicate was taken to measure possible field sampling error or local environmental variance. Duplicate samples are taken at a frequency of 1 out of 10 for groundwater and soil samples. Relative percent differences values are calculated for each duplicate that has a concentration at or greater than five times the reported detection limit (RDL). A summary of RPDs for duplicate samples collected is provided in Tables 2 to 14 (see Appendices).

The BC Field Sampling Manual identifies RPD values >20% as an indication that a possible problem exists, and >50% indicates that a definite problem exists, most likely either through contamination or lack of sample representativeness (BC MOE, 2013). During the 2017 to 2020 investigations, a total of ten soil duplicate samples and nine groundwater duplicate samples were analysed for concentrations of hydrocarbons, metals, PAHs, VOCs and major ions.

The RPD values for total of 773 groundwater parameters were calculated. Out of 743 groundwater RPDs, a total of 10 metal parameters had a calculated RPD value greater than 50% and one (1) pH parameter had a calculated RPD value greater than 20%. The remaining groundwater RPDs were either below the

target RPD of 20% or not calculable due to concentrations reported as less than detection limits. The RPD values for total of 587 soil parameters were calculated. Out of 587 soil RPDs, a total of six metal parameters had a calculated RPD value greater than 20% and four (4) metal parameters had a calculated RPD value greater than 50%. One (1) EPH<sub>10-19</sub> parameter had a calculated RPD value greater than 50%. The remaining soil RPDs were either below the target RPD of 20% or not calculable due to concentrations that are less than detection limits. Out of 773 duplicate groundwater parameters, less than 1.5% exceeded the target RPD and out of 587 duplicate soil parameters, less than 2% exceeded the target RPD. Some errors in sampling are anticipated during a large site investigation and this can be further compounded by the heterogeneity of concentrations in soil; however, overall the field QA/QC project has met Wood's data quality objectives.

To ensure data quality, a total of about 1,200 lab control parameters (Method Blank, Matrix Spike, Laboratory Control Sample, Certified Reference Material, Internal Reference Material and Calibration Verification Standard) were analyzed by the laboratory ALS for a variety of analytical parameters. The laboratory QA/QC testing indicated the results are within the ALS data quality objectives, and therefore the analytical testing is considered reliable. A full list of laboratories' COAs is included in Appendix B.

Based on the field and laboratory procedures used, QA/QC results and data validation, it is concluded that the data generated for the Site meet accuracy and precision targets and are reliable in characterizing Site environmental conditions.

## 6.0 Discussion

The investigation results as they pertain to the specific objectives of the 2020 SSI are discussed separately in the following sections. The conclusions on an individual APEC/AEC basis are discussed under Section 7.

### 6.1 In-Situ Hydrocarbon Remediation

Based on the results of the Year End sampling from Treatment Area 1 (fuel line area) and Treatment Area 2 (tank farm), Wood prepared the following box plots to show the concentrations of petroleum hydrocarbons in treated material over time. Chart 1 and Chart 2 below show the initial concentrations of LEPH and HEPH from AEC 2 plotted into a box plot. The initial concentrations are based on the in-situ sampling of hydrocarbons completed by Wood during the 2017 SI. The initial concentrations are then compared to box plots generated by measured concentrations of post-excavation interim samples. The data used to generate the box plots are included as Appendix C. For comparison purposes only, the box plot data are compared to the BC CSR (BC Regulation 375/96, last amended January 24, 2019, BC Reg. 13/2019) reverted Wildlands (WL<sub>R</sub>) standards of 1,000 mg/kg for LEPH and HEPH.

#### Treatment Area 1

The 2020-year end sampling event completed in August 2020 for Treatment Area 1 indicates that the 95<sup>th</sup> percentile of the LEPH concentration is greater than the CSR standard of 1,000 mg/kg. This is due to one soil sample (SP20-01-05) which contained a LEPH concentration of 1,330 mg/kg. All remaining samples analyzed for LEPH from Treatment Area 1 contained concentrations of LEPH that were less than 1,000 mg/kg.

All soil samples collected during the August 2020 sampling event for Treatment Area 1 contained concentrations of HEPH of less than 1,000 mg/kg, and the majority was below the method detection limit. Table 4 below shows the 95<sup>th</sup> percentile for the 2020 sampling event completed on Treatment Area 1.

**Table 4: Treatment Area 1 – 95<sup>th</sup> Percentile for LEPH by Sampling Event**

Sampling Event	95 <sup>th</sup> Percentile (mg/kg)	Average Concentration (mg/kg)
2017 In-Situ (LEPH)	3748	3138
2018 (Year End) LEPH	3582	1857
2019 (Mid-Year) LEPH	2005	1217
2019 (Year End) LEPH	1394	738
2020 (Year End) LEPH	1164	710

**Chart 1: Treatment Area 1 – Petroleum Hydrocarbon Concentrations**

**Treatment Area 2**

The 2020-year end sampling event completed in August 2020 for Treatment Area 2 indicates that the 95<sup>th</sup> percentile of the LEPH concentration is greater than the CSR standard of 1,000 mg/kg. This is due to four out of twelve soil samples (SP20-02-03, SP20-02-05, SP20-02-06 and SP20-02-10) which contained LEPH concentrations greater than 1,000 mg/kg (ranging from 1,040 to 1,660 mg/kg). The remaining soil samples analyzed for LEPH from Treatment Area 2 contained concentrations of LEPH that were less than 1,000 mg/kg, and four of those were below laboratory detection limits.

All soil samples collected during the August 2020 sampling event for Treatment Area 2 contained concentrations of HEPH of less than 1,000 mg/kg. Table 5 below shows the 95<sup>th</sup> percentile for the year end sampling event of Treatment Area 2.

**Table 5: Treatment Area 2 – 95<sup>th</sup> Percentile for LEPH by Sampling Event**

Sampling Event	95 <sup>th</sup> Percentile (mg/kg)	Average Concentration (mg/kg)
2017 In-Situ (LEPH)	3748	3138
2019 (Year End) LEPH	2772	1619
2020 (Year End) LEPH	1292	813

**Chart 2: Treatment Area 2 – Petroleum Hydrocarbon Concentrations**

The 95<sup>th</sup> percentile is not used to determine if the soil can be considered remediated; instead it is used to estimate the concentration of hydrocarbons in the entire stockpile based on limited soil sampling data. Based on the data in Table 5, we can infer that concentrations of LEPH have significantly decreased and 95% of the soil should contain LEPH concentrations less than 1,164 mg/kg and 1,292 mg/kg for Treatment Areas 1 and 2, respectively. The decrease of LEPHs concentrations is especially observed for Treatment Area 2 where 95<sup>th</sup> percentile concentrations in 2020 are almost 50% of those observed in 2019. The box plot is a good indicator of when confirmation of remediation sampling should be completed on treated soil.

## 6.2 Petroleum Hydrocarbons Groundwater Investigation

As mentioned before, for discussion purpose only, a parameter is considered elevated when it exceeded 5 times the laboratory MDL.

The Site investigation work completed by Wood during 2020 field season identified elevated concentrations of petroleum hydrocarbons in groundwater. Groundwater wells with elevated concentrations of petroleum hydrocarbons are shown in Figures 13 to 18 (see Appendices) and in Table 6 below.

**Table 6: Summary of Impacted Monitoring Wells with Petroleum Hydrocarbons**

APEC / AEC #	Monitoring Well	COCs*
AEC 1: Mill / 10 Level Portal	MW17-04B	methylnaphthalene,
AEC 2: Tank Farm / Fuel Lines	MW17-17A	methylnaphthalene
	MW17-17B	LNAPL measured in well
Downstream of the Tailings Impoundment	MW17-20A	methylnaphthalene and naphthalene
APEC 9: Main Landfill	MW17-22A	BTEX, methylnaphthalene and naphthalene

\* COCs considered in Table 6 are elevated concentrations identified with results more than five times the method detection limit (MDL)

Groundwater impacted by petroleum hydrocarbons was identified at AEC 1 and AEC 2. LNAPL was identified at monitoring well MW17-17B. Soil impacted by petroleum hydrocarbons was also identified within these AECs during previous assessments. Soil contamination identified within those AECs have impacted groundwater quality.

Elevated concentrations of methylnaphthalene and naphthalene were observed downstream of the Tailings Impoundment (MW17-20A) in the 2020 sampling event; however, they were lower than the previous groundwater sampling events completed in July and October 2017. The groundwater quality in that area seems to have improved since 2017. Natural attenuation is likely occurring and concentrations of PHCs appear to be decreasing with time.

Elevated concentrations of ethylbenzene, methylnaphthalene and naphthalene were observed downstream of the Main Landfill (APEC 9) (MW17-22A); however, they were lower or within the same range than the previous groundwater sampling events completed in July and October 2017, July and September 2018 and July 2019. The groundwater quality in that area seems to have improved since 2017. Natural attenuation is likely occurring and concentrations of PHCs appear to be decreasing with time.

### 6.3 Background Metals Groundwater Investigation

The Site investigation work completed by Wood during the 2017 to 2020 field seasons identified elevated concentrations of dissolved metals: aluminum, antimony, cobalt, manganese, iron, lithium, uranium and arsenic in groundwater. Groundwater wells with elevated concentrations of metals are shown in Figures 13 to 18 (see Appendices).

In 2020, Wood completed additional groundwater sampling to supplement the existing dataset. The 2020 sampling focused on groundwater wells that are considered representative of background conditions (Upstream). Wood also sampled groundwater wells located within areas where mining activity occurred (Midstream) and where PAG material was placed, in ore processing areas and in concentrate storage areas. Additionally, Wood sampled groundwater wells that are considered to be located downgradient of historical mining activity (Downstream). The following Table 7 summarizes the groundwater wells sampled during the period of 2017 and 2020 and their classification in regards to an upstream, downstream and midstream location. The geology that the well screen has been installed in is also included in Table 7.

**Table 7: Summary of Well Location and Geology at Well Screen**

<b>APEC / AEC #</b>	<b>Monitoring Well</b>	<b>Location</b>	<b>Geology at Well Screen</b>
AEC 1: Mill / 10 Level Portal	MW17-01A	Midstream	Bedrock
AEC 1: Mill / 10 Level Portal	MW17-01B	Midstream	Overburden
AEC 1: Mill / 10 Level Portal	MW17-02A	Midstream	Bedrock
AEC 1: Mill / 10 Level Portal	MW17-02B	Midstream	Bedrock
AEC 1: Mill / 10 Level Portal	MW17-03	Midstream	Bedrock
AEC 1: Mill / 10 Level Portal	MW17-04A	Midstream	Bedrock
AEC 1: Mill / 10 Level Portal	MW17-04B	Midstream	Overburden
AEC 1: Mill / 10 Level Portal	MW17-05A	Midstream	Bedrock
AEC 1: Mill / 10 Level Portal	MW17-05B	Midstream	Bedrock

Johnny Creek Drainage	MW17-26B	Upstream	Overburden
AEC 6: Airstrip	MW17-27A	Midstream	Bedrock
AEC 6: Airstrip	MW17-27B	Midstream	Bedrock
Stonehouse Creek	MW17-28	Downstream	Overburden

Using the upstream, midstream and downstream classification in Table 7 and the concentrations at each sample location presented in the attached Table 12, Wood prepared boxplots for each sampling location for select metals. The box plots and the data used to generate the box plots are presented as Appendix C. Box plots are generally evaluated against each other by determining if the boxes overlap with each other or if the median value overlaps with the box generated by the plots. The background concentrations were considered using the upstream monitoring wells concentrations. An increase in dissolved metals concentrations between background locations and midstream locations could indicate the groundwater has been impacted by mining activities.

The following sections discuss metal parameter and evaluate if the observed exceedances can be attributed to background or should be carried forward as a COC for groundwater. For discussion purposes, results were also compared to the Contaminated Sites Regulation (CSR) (BC Regulation 375/96, last amended January 24, 2019, BC Reg. 13/2019) Freshwater Aquatic Life use (AW<sub>F</sub>) standards. Wood notes that the CSR standards are not applicable to the core area of a permitted mine and this comparison has been used as a screening tool to focus on parameters that may require additional investigation.

### 6.3.1 Antimony

The box plots for antimony and the data used to generate the box plots are presented as Appendix C. The plots generated from the upstream areas show that the data obtained is within the background box plot range. The box plots generated for the midstream areas show that the data obtained from sampling locations MW17-01, MW17-02, MW17-08, MW17-12, and MW17-25 are outside of the background box plot range. The box plots generated for the downstream areas show that the data obtained from sampling locations MW17-27 are outside of the background box plot range.

Concentrations of antimony from sample location MW17-01, MW17-02, MW17-08, MW17-12, MW17-25 and MW17-27 are less than BC CSR AW<sub>F</sub> standard of 90 µg/L.

Additionally, groundwater wells MW17-27A and MW17-25A were resampled on August 25 and 28, 2020 and reported results of 0.98 µg/L and 1.18 µg/L, respectively. Monitoring well MW17-27B was not resampled in 2020. Groundwater well MW17-08A has not been sampled since July 24, 2017. Groundwater sample from monitoring well MW17-08A contained antimony concentrations of 6.37 µg/L, well below the CSR AW<sub>F</sub> standard of 90 µg/L.

### 6.3.2 Arsenic

The box plots for arsenic and the data used to generate the box plots are presented as Appendix C. The box plots generated for the midstream areas show that the data obtained from sampling location MW17-12 are outside of the background box plot range. The box plots generated for the downstream areas show that the data obtained from sampling locations MW17-24, MW17-27 and MW17-28 are outside of the background box plot range.

Concentrations of arsenic from sample location MW17-12, MW17-24, MW17-27A and MW17-28 are less than BC CSR AW<sub>F</sub> standard of 50 µg/L.

Monitoring well MW17-27A contained an arsenic concentration of 32.1 µg/L during the July 24, 2017 sampling event. Groundwater well MW17-27A was resampled on July 16, 2019 and August 28, 2020 and reported results were respectively 2.4 µg/L and 2.94 µg/L.

### 6.3.3 Uranium

The box plots for uranium and the data used to generate the box plots are presented as Appendix C. The box plots generated for the midstream areas show that the data obtained from sampling locations MW17-1, MW17-2, MW17-3, MW17-10 and MW17-12 are outside of the background box plot range. The box plots generated for the downstream areas show that the data obtained from sampling locations, MW17-11 and MW17-28 are outside of the background box plot range.

Concentrations of uranium from sample locations MW17-1, MW17-2, MW17-3, MW17-10, MW17-12, MW17-11 and MW17-28 are less than BC CSR AW<sub>F</sub> standard of 85 µg/L. Monitoring well MW17-09A

contained a uranium concentration of 39.1 µg/L. Groundwater well MW17-09A was previously sampled for uranium on July 28, 2017, July 2, 2018 and November 18 2018 and July 16, 2019 and the results were 11.7 µg/L, 0.079 µg/L, 1.95 µg/L and 12.8 µg/L, respectively. Monitoring well MW17-09A was resampled on August 20, 2020 and the reported result is 5.94 µg/L.

### 6.3.4 Iron

The box plots for iron and the data used to generate the box plots are presented as Appendix C. The box plots generated for the midstream areas show that the data obtained from sampling locations MW17-4, MW17-5, MW17-9, MW17-13 and MW17-14 are outside of the background box plot range. The box plots generated for the downstream areas are within the background box plot range.

No BC CSR AW<sub>F</sub> standard apply for iron. Groundwater well MW17-05B was resampled for iron on July 17, 2019 and September 5, 2019 and the results were 533 µg/L and 846 µg/L, respectively. Monitoring well MW17-05B was resampled on August 23, 2020 and the reported result is 390 µg/L.

### 6.3.5 Lithium

The box plots for lithium and the data used to generate the box plots are presented as Appendix C. The box plots generated for the midstream areas are within the background box plot range. The box plots generated for the upstream areas are within the background box plot range. No BC CSR AW<sub>F</sub> standard apply for lithium.

However, monitoring wells MW17-09A and MW17-24A located midstream contained a lithium concentration of 8.5 µg/L and 8.4 µg/L, respectively. Monitoring well MW17-21A located upstream contained a lithium concentration of 8.5 µg/L during the August 2020 sampling event. Monitoring well MW17-09A contained a lithium concentration of 9.1 µg/L during the July 24, 2017 sampling event. Groundwater well MW17-09A was previously sampled for lithium on July 28, 2017, July 2, 2018, November 18, 2018 and July 17, 2019 and the results were <50 µg/L, <1.0 µg/L, 7.5 µg/L and 7.3 µg/L, respectively. Groundwater well MW17-24A was previously sampled for lithium on July 23, 2017, July 15, 2019 and September 4, 2019 and the results were <50 µg/L, 7.6 µg/L and 7.2 µg/L, respectively.

### 6.3.6 Cobalt

The box plots for cobalt in groundwater and the data used to generate the box plots are presented as Appendix C. Wood was provided with laboratory reports containing metals analysis of surface water samples collected across the mine site by Environmental Resources Management (ERM). Using the surface water data, Wood generated similar box plots showing the cobalt concentrations in surface water at various sampling points. The box plots and the data used to generate the surface water box plots are presented as Appendix C.

The box plots generated for the midstream areas show that the data obtained from sampling locations MW17-05, MW17-06 and MW17-09 are outside of the upstream box plot range. The box plots generated for the downstream areas show that the data obtained from sampling location MW17-27 is outside of the upstream box plot range.

Based on the surface water data, it is likely that surface water migrating through mine impacted areas is either the source or a contributor to the elevated cobalt concentrations in groundwater. Table 8 below shows the sampling events where elevated cobalt was identified.

**Table 8: Summary of Elevated Cobalt**

APEC	Monitoring Well	Sample Date	Location	Geology	Cobalt (µg/L)
AEC 1: Mill / 10 Level Portal	MW17-05B	19-Jul-17	Midstream	Bedrock	26.2
AEC 1: Mill / 10 Level Portal	MW17-05B	17-Jul-19	Midstream	Bedrock	3.99
AEC 1: Mill / 10 Level Portal	MW17-05B (DUP)	17-Jul-19	Midstream	Bedrock	4.1
AEC 1: Mill / 10 Level Portal	MW17-05B	5-Sep-19	Midstream	Bedrock	3.94
AEC 1: Mill / 10 Level Portal	MW17-05B	23-Aug-20	Midstream	Bedrock	1.94
AEC 1: Mill / 10 Level Portal	MW17-06B	19-Jul-17	Midstream	Bedrock	1.64
APEC 10: Burial Site 1	MW17-09A	2-Jul-18	Midstream	Bedrock	14.6
APEC 10: Burial Site 1	MW17-09B	24-Jul-17	Midstream	Overburden	8.04
APEC 10: Burial Site 1	MW17-09B	2-Jul-18	Midstream	Overburden	8.38
APEC 10: Burial Site 1	MW17-09B	18-Nov-18	Midstream	Overburden	15.8
APEC 10: Burial Site 1	MW17-09B	17-Jul-19	Midstream	Overburden	13.8
APEC 10: Burial Site 1	MW17-09B	23-Aug-20	Midstream	Overburden	2.96
AEC 6: Airstrip	MW17-27A	28-Aug-20	Downstream	Overburden	1.44
AEC 6: Airstrip	MW17-27B	24-Jul-17	Downstream	Bedrock	1.9
AEC 6: Airstrip	MW17-27B	16-Jul-19	Downstream	Bedrock	1.27

Cobalt concentrations were all less than BC CSR AW<sub>F</sub> standard of 40 µg/L. However, a groundwater sample collected from monitoring well MW17-05B contained a cobalt concentration of 26.2 µg/L. Groundwater well MW17-05B was subsequently resampled for cobalt on July 17, 2019, September 5, 2019 and August 23, 2020, and the results were 3.99 µg/L, 3.94 µg/L, and 1.94 µg/L respectively. A blind duplicate groundwater sample was submitted for laboratory analysis on July 19, 2017 that contained a concentration of cobalt of 4.1 µg/L. The measured concentrations of cobalt in monitoring well MW17-05B are plotted on Chart 3 along with a linear trend line. The general trend appears to be that cobalt concentrations are decreasing over time in monitoring well MW17-05B.

**Chart 3: Cobalt Concentrations in MW17-05B (AEC 1: Mill / 10 Level Portal)**

As the subsequent analysis of groundwater from monitoring well MW17-05B indicates that the cobalt is not elevated, it is confirmed that cobalt will not be carried forward as a COC.

### 6.3.7 Manganese

The box plots for manganese in groundwater and the data used to generate the box plots are presented as Appendix C. Wood was provided with laboratory reports containing metals analysis of surface water samples collected across the mine site by RTEC. Using the surface water data, Wood generated similar box plots showing the manganese concentrations in surface water at various sampling points.

The box plots generated for the midstream areas show that the data obtained from sampling locations MW17-02, MW17-03, MW17-04, MW17-05, MW17-06, MW17-09, MW17-10 and MW17-13 are outside of the background box plot range. The box plots generated for the downstream areas show that the data obtained from sampling location MW17-11 is outside of the background box plot range. No BC CSR AWF standard apply for manganese.

Based on a review of box plots, it appears that there is elevated manganese in groundwater. Surface water migrating through mine impacted areas is a potential contributor to the elevated manganese concentrations in groundwater. Another potential source of elevated manganese concentrations at the Site may be related to elevated concentrations of hydrocarbons in some monitoring wells. Natural attenuation of hydrocarbons depletes dissolved oxygen in groundwater resulting in the reductive dissolution of manganese from soil. The resulting increase in manganese in groundwater is generally considered a short-term phenomenon as it is expected to precipitate out when aerobic conditions return after the hydrocarbon plume has sufficiently attenuated.

Elevated concentrations of manganese were observed at the groundwater wells MW17-04, MW17-06, MW17-09 and MW17-13 that were impacted with hydrocarbons or PAHs.

Chart 4 shows the concentration of manganese in monitoring wells MW17-04B, MW17-05B, MW17-06B, MW17-9A, MW17-9B, MW17-13 and MW17-14A.

Chart 4: Manganese Concentrations in Groundwater

### 6.3.8 Landfill Compliance Groundwater Monitoring

Permit PR-7927 authorizing the discharge of waste to the Main Landfill includes provisions for annual groundwater monitoring for a period of five years starting in the summer of 2018. The permit requires annual groundwater sampling be conducted at MW17-22A and MW17-22B during summer months. Groundwater quality monitoring parameters include:

- **Field Parameters:** specific electrical conductivity, temperature, ORP, and pH; and
- **Analytical Parameters:** BTEX, EPH, PAH, dissolved metals, pH, alkalinity, bicarbonate, carbonate, chloride, electrical conductivity (EC), fluoride, hardness, hydroxide, total iron, total magnesium, total manganese, nitrate, nitrite, ammonia, total potassium, total sodium, sulphate, TDS, TIC, TOC, COD and turbidity, acidity (hot peroxide titration) and cyanides (weak acid dissociable (WAD), free, total, cyanate and thiocyanate).

Light-end petroleum hydrocarbon (BTEX) concentrations were detectable in the groundwater samples from the deep well (MW17-22A) in 2018 and 2019; however, elevated concentrations of toluene and xylenes were not identified in the 2020 sampling event, as it was during the previous groundwater sampling event. Concentrations of ethylbenzene were observed but were more than three times lower

than the one observed in 2019. Concentrations of BTEX were not detected in the groundwater samples from the shallow well (MW17-22B). Concentrations of heavier end hydrocarbons (VH<sub>w</sub>, LEPH<sub>w</sub>) were not detected in groundwater samples collected from the shallow well (MW17-22B) or in the deep well (MW17-22A) in 2020, confirming the results of 2019. Concentrations of naphthalene in groundwater from MW17-22A were elevated in 2020; and measured concentrations were slightly higher than the 2019 sampling events. However, the concentrations were still lower than those observed in 2017 and 2018. No PAHs were detected in the shallow well (MW17-22B). Concentrations of ethylbenzene, xylenes and naphthalene in groundwater at the deep well (MW17-22A) demonstrate a steady declining trend over time which is likely attributed to the natural attenuation of a finite and localized source.

Concentrations of dissolved metals in the groundwater samples from MW17-22A and MW17-22B were reported at low levels for all sampling events in 2017, 2018, 2019 and 2020. The measured dissolved metals concentrations from the 2020 sampling are consistent with concentrations observed during the previous Site Investigation.

Total metals in groundwater samples were analysed in 2019 and 2020. The results indicated that the groundwater sample collected from the shallow groundwater well MW17-22B contained an elevated concentration of total cobalt in 2019. In 2020, cobalt concentration was lower than the MDL. Total metals were detected at concentrations generally higher compared to 2019 results for MW17-22A, and at concentrations generally lower compared to 2019 results for MW17-22B. It should be noted that analysis of dissolved metals in groundwater well MW17-22B in 2017, 2018, 2019 and 2020 did not identify elevated concentrations of metals.

All cyanide species were reported at low concentrations in groundwater samples collected from both MW17-22A and MW17-22B during the 2017, 2018, 2019 and 2020 sampling events.

## 6.4 Surface Water Investigation

Surface water sample SW20-02 located at AEC 1 (Mill – 10 Level Portal) contained a detectable concentration of methylnaphthalene.

## 7.0 Conclusions

The following conclusions were made during this assessment as they relate to the objectives and scope of work defined in Sections 2.0 and 3.0.

### 7.1 Physical Remediation – Soil Hydrocarbon Contamination

In 2020, Wood completed a year-end sampling of Treatment Area 1 and Treatment Area 2 to determine the effectiveness of the remediation program. Based on the results of the 2020 soil sampling and the data collected during the 2017 SI, 2018 SSI and 2019 SSI, concentrations of LEPH have decreased significantly as shown in the following tables.

**Treatment Area 1 – 95<sup>th</sup> Percentile Over Time**

Sampling Event	95 <sup>th</sup> Percentile (mg/kg)	Average Concentration (mg/kg)
2017 In-Situ (LEPH)	3748	3138
2018 (Year End) LEPH	3582	1857
2019 (Mid-Year) LEPH	2005	1217
2019 (Year End) LEPH	1394	738
2020 (Year End) LEPH	1164	710

**Treatment Area 2 – 95<sup>th</sup> Percentile 2019 Year End Sampling**

Sampling Event	95 <sup>th</sup> Percentile (mg/kg)	Average Concentration (mg/kg)
2017 In-Situ (LEPH)	3748	3138
2019 (Year End) LEPH	2772	1619
2020 (Year End) LEPH	1292	813

### 7.2 Groundwater Sampling Program - Hydrocarbons

Groundwater impacted by petroleum hydrocarbons was identified at AEC 1 and AEC 2. LNAPL was identified at monitoring well MW17-17B. Soil impacted by petroleum hydrocarbons has also been identified at those AECs during previous assessments. Contamination identified within those AECs have impacted groundwater quality.

Concentrations observed in 2020 for PAHs downstream of the TSF (MW17-20A) were lower than the previous groundwater sampling events completed in July and October 2017. The groundwater quality in that area has improved since 2017. Natural attenuation is present and concentrations are decreasing with time.

Concentrations observed in 2020 for BTEX and PAHs at the Main Landfill (APEC 9) (MW17-22A) were lower than the previous groundwater sampling events completed in July and October 2017. The groundwater quality in that area has improved since 2017. Natural attenuation is present and concentrations are decreasing with time.

### 7.3 Background Groundwater Assessment

The 2017 to 2020 field investigations identified elevated concentrations of dissolved metals: antimony, cobalt, manganese, cadmium, copper, lithium, iron, uranium and arsenic in groundwater. An assessment of background concentrations of dissolved metals has indicated that antimony, arsenic, uranium, iron, lithium, cobalt and manganese are elevated compared to background concentrations and could be attributed to historical mining activities. Wood observed that the concentrations of dissolved metals are generally decreasing over time. When compared to the CSR, many of the dissolved metals concentrations that are elevated are still less than CSR AW<sub>F</sub>. Based on observed concentrations compared to background, manganese appears to be the remaining dissolved metals that would require further assessment.

Elevated dissolved concentrations of manganese appear to be associated with the AEC 1 – Mill Building and 10 Level Portal; however, elevated manganese was also identified at APEC 10 – Burial Site # 1, APEC 12 – Burial Site # 2 and at AEC 2 – Tank Farm and Fuel Line area. The location where elevated manganese is identified were all in disturbed areas and the highest concentrations were found around the AEC 1 – Mill Building and 10 Level Portal.

### 7.4 Surface Water Sampling

Surface water sample SW20-02, located at AEC 1 (Mill – 10 Level Portal), contained a detectable concentration of methylnaphthalene. It has not been determined if the detectable concentration can be related to former activities at AEC 1 or were introduced during laboratory testing. Traces of contaminants are commonly introduced during laboratory testing; however, the concentrations are not considered significant by the lab if they are less than a pre-determined limit. Wood recommends to re-sample this location during the next field season for analysis of methylnaphthalene to confirm the detection in surface water.

### 7.5 Summary of APECs and AECs

Based on the results of the 2020 SSI, the following APECs/AECs in the table below are recommended to be carried forward for additional assessment and/or remediation work.

Summary of AECs and Associated PCOCs and COCs

Initial APEC	Description	2019 Classification	Contaminant Type	Potential contaminants of concern (PCOCs) <sup>1</sup>	Contaminants of Concern (COCs) <sup>2</sup>
APEC 1	Mill / 10 Level Portal	AEC 1	Diesel fuel and lubricants	Groundwater: cobalt, manganese	Soil: heavy extractable petroleum hydrocarbons (HEPH)  Groundwater: manganese, acenaphthene, methylnaphthalene, LEPH <sub>w</sub> , extractable petroleum hydrocarbons (EPH <sub>w10-19</sub> )
APEC 2 / APEC 14	Tank Farm Area / Fuel Lines	AEC 2	Diesel fuel, aviation fuels and possibly	Groundwater: manganese	Soil: volatile petroleum hydrocarbons (VPH <sub>s</sub> ), LEPH <sub>s</sub>  Groundwater: Groundwater: manganese, LNAPL,

Initial APEC	Description	2019 Classification	Contaminant Type	Potential contaminants of concern (PCOCs) <sup>1</sup>	Contaminants of Concern (COCs) <sup>2</sup>
			gasoline, waste rock		methylnaphthalene and LEPH <sub>w</sub>
APEC 4	Fuel Pump Shed	AEC 3	Diesel fuel and Avgas		Soil: LEPH
APEC 5	Mechanical Shop / 11 Level Portal	AEC 4	Fuels, lubricants, and waste rock storage		Soil: toluene, xylenes, VPHs, LEPH and HEPH
APEC 9	Main Landfill	AEC 5	Inferred to be diesel fuel	-	Groundwater: BTEX, LEPHW, methylnaphthalene, naphthalene and metals
APEC 10	Burial Site 1 (Fmr. Chalet)	APEC 10	Waste rock	Groundwater: manganese	Groundwater: manganese
APEC 11	Airstrip	AEC 6	Waste rock	Groundwater: metals	-
APEC 12	Burial Site #2	APEC 12	Contents of burial site, waste rock	Groundwater: manganese	Groundwater: manganese
APEC 13	Warehouse East Area	AEC 7	Stored / used fuel and lubricants	Groundwater: BTEX, LEPH <sub>w</sub> , naphthalene and metals	Soil: LEPH, HEPH

**Notes:**

- <sup>1</sup> Elevated metal concentrations in soil are expected across the surface of a mine site. Elevated metals in soil may need to be addressed through determining background concentrations or through a risk assessment.
- <sup>2</sup> Note, PAG material is identified in other locations within the mine site; however, those areas have been identified by SnipGold and are scheduled for removal to the TSF. This has been included as an APEC due to potential for metals leaching.

## 8.0 Closure

This report was prepared exclusively for SnipGold Corporation by Wood Environment & Infrastructure Solutions (Wood). The information, conclusions and estimates contained in this report are based exclusively on: i) information available at the time of preparation, ii) the accuracy and completeness of data supplied by the Client or by third parties as instructed by the Client, and iii) the assumptions, conditions and qualifications/limitations set forth in this report.

The field work completed in this program was completed in general accordance with industry standards with limits imposed by existing infrastructure and site conditions. Interpretations and conclusions made within this report were based upon the field work and discussions with SnipGold Corporation staff.

This report has been prepared in accordance with generally accepted practices in the environmental industry. No other warranty, expressed or implied, is made.

Respectfully submitted,

**Wood Environment & Infrastructure Solutions**  
a Division of Wood Canada Limited

**Prepared by:**

**Aymeric Devaux, M.Sc., P.Ag.**

Zirconium	µg/g	1.0	20	-	-	-	-

**Notes:**

- MDL = Method Detection Limit
- mbg = metres below grade
- na = not analyzed
- nm = not measured
- no = none observed
- ns = no applicable standard
- µg/g = micrograms per gram (equivalent to mg/kg and parts per million (ppm))
- < = concentration is less than reported method detection limit
- > = reported greater than value due to instrumentation and method limita
- = no applicable units / method detection limit

**QA/QC**

- 3 = allowable RPDs as identified in BC Environmental Laboratory Manual (February 2016), Section A, Table 2
- nc = not calculated
- RPD = Representative percent difference
- 1** = calculated RPD exceeds allowable RPD

**Table 5: VOCs**

**QA/QC**

1. Allowable RPDs as identified in BC Environmental Laboratory Manual (February 2016), Section A, Table 2
2. RPDs calculated only where both values are greater than 5 times the method detection limit

-	= not calculated
RPD	= Representative percent difference
1	= calculated RPD exceeds allowable RPD

**QA/QC**

1. Allowable RPDs as identified in BC Environmental Laboratory Manual (February 2016), Section A, Table 2
2. RPDs calculated only where both values are greater than 5 times the method detection limit
  - = not calculated
  - RPD = Representative percent difference
  - 1 = calculated RPD exceeds allowable RPD

**Notes:**

- MDL = Method detection limit
- no = none observed
- nm = not measured
- ns = no applicable standard
- µg/L = microgram per litre
- µs/cm = microsiemens per centimeter
- < = concentration is less than reported method detection limit

**QA/QC**

1. Allowable RPDs as identified in BC Environmental Laboratory Manual (February 2016), Section A, Table 2
  2. RPDs calculated only where both values are greater than 5 times the method detection limit
- = not calculated
  - RPD = Representative percent difference
  - 1 = calculated RPD exceeds allowable RPD

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

**Signatories**

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Laboratory Department</i>
Brianna Allen	Department Manager - Organics	Organics, Burnaby, British Columbia
Dwayne Bennett	Technical Specialist	Inorganics, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Jeremy Paterson	Analyst	Microbiology, Winnipeg, Manitoba
Melissa Shaw	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Xihua Yao	Laboratory Analyst	Inorganics, Saskatoon, Saskatchewan

## General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances  
LOR: Limit of Reporting (detection limit).

Unit	Description
%	percent
CFU/g	Colony Forming Units per gram
mg/kg	milligrams per kilogram

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "**Preliminary Report**" are considered authorized for use.

## Workorder Comments

**Sample "SP20-01-14": client labelled one jar and one plastic bag sample as "SP20-1-4", labelled the sample as "SP20-01-14" according to the identification of the bag.**

Additional parameters were requestd via email for samples SP20-01-01, SP20-01-03, SP20-01-05 and SP20-01-05.

## Sample Comments

Sample	Client Id	Comment
VA20B4299-001	SP20-01-01	Sample(s)-007: Soil jar was submitted as VOC sample container. VOC results may be biased low, and do not meet federal (CCME) or provincial requirements (for BC, AB-Tier1, MB, ON, SK).

## Qualifiers

Qualifier	Description
DLCI	Detection Limit Raised: Chromatographic interference due to co-elution.

## QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: <b>VA20B4299</b>	Page	: 1 of 15
Client	: <b>Seabridge Gold Inc.</b>	Laboratory	: Vancouver - Environmental
Contact	: Elizabeth Miller	Account Manager	: Selam Worku
Address	: 1235 Main Street P.O. Box 2536 Smithers BC Canada V0J 2N0	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: 416 367 9292	Telephone	: +1 604 253 4188
Project	: VE52655D	Date Samples Received	: 02-Sep-2020 10:45
PO	:	Issue Date	: 28-Sep-2020 14:20
C-O-C number	: ----		
Sampler	: Ardy M		
Site	: ----		
Quote number	: VA20-SEAB100-0003 - Wood/Seabridge Gold		
No. of samples received	: 10		
No. of samples analysed	: 7		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

### Key

- Anonymous:** Refers to samples which are not part of this work order, but which formed part of the QC process lot.
- CAS Number:** Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
- DQO:** Data Quality Objective.
- LOR:** Limit of Reporting (detection limit).
- RPD:** Relative Percent Difference.

## Summary of Outliers

### **Outliers : Quality Control Samples**

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Matrix Spike outliers occur.
- Laboratory Control Sample (LCS) outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

### **Outliers: Reference Material (RM) Samples**

- No Reference Material (RM) Sample outliers occur.

### **Outliers : Analysis Holding Time Compliance (Breaches)**

- Analysis Holding Time Outliers exist - please see following pages for full details.

### **Outliers : Frequency of Quality Control Samples**

- No Quality Control Sample Frequency Outliers occur.

**Outliers : Quality Control Samples**

*Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes*

Matrix: **Soil/Solid**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
<b>Laboratory Control Sample (LCS) Recoveries</b>								
Volatile Organic Compounds	QC-MRG3-8244500 2	----	chloromethane	74-87-3	E611C	46.6 % LCS-ND	60.0-140%	Recovery less than lower control limit

**Result Qualifiers**

Qualifier	Description
LCS-ND	Lab Control Sample recovery was slightly outside ALS DQO. Reported non-detect results for associated samples were unaffected.

## Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

## Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Soil/Solid**

Evaluation: \* = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type	Method	QC Lot #	Count		Frequency (%)		Evaluation
			QC	Regular	Actual	Expected	
<b>Analytical Methods</b>							
<b>Laboratory Duplicates (DUP)</b>							
Available Nitrate and Nitrite by Colourimetry (0.01M Calcium Chloride Ext.)	E269.N+N	84477	1	9	11.1	5.0	✓
Available Phosphorus by FIALab (Modified Kelowna)	E384	86217	1	9	11.1	5.0	✓

## Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Moisture Content by Gravimetry	E144 Vancouver - Environmental	Soil/Solid	CCME PHC in Soil - Tier 1	Moisture is measured gravimetrically by drying the sample at 105°C. Moisture content is calculated as the weight loss (due to water) divided by the wet weight of the sample, expressed as a percentage.
Available Nitrate and Nitrite by Colourimetry (0.01M Calcium Chloride Ext.)	E269.N+N Saskatoon - Environmental	Soil/Solid	Alberta Agriculture/APHA 4500-NO3 I (mod)	Plant available nitrate and nitrite are analyzed by colourimetry using a flow injection analyzer on a soil sample extract that has been extracted using 0.01M Calcium Chloride, then shaken well and filtered prior to analysis.
Total Carbon by Combustion	E351 Saskatoon - Environmental	Soil/Solid	CSSS (2008) 21.2 (mod)	Total Carbon is determined by the high temperature combustion method with measurement by an infrared detector.
Total Inorganic Carbon by Acetic Acid pH Standard Curve	E354 Saskatoon - Environmental	Soil/Solid	CSSS (2008) 20.2	Total Inorganic Carbon is determined by acetic acid pH standard curve, where a known quantity of acetic acid is consumed by reaction with carbonates in the soil. The pH of the resulting solution is measured and compared against a standard curve relating pH to weight of carbonate.
Available Phosphorus by FIALab (Modified Kelowna)	E384 Saskatoon - Environmental	Soil/Solid	Comm. Soil Sci. Plant Anal, 25 (5&6)	Plant available phosphorus is extracted from air dried soil using a fixed ratio Modified Kelowna extraction. Phosphorus is determined by colorimetry using a flow injection analyzer.
Available Potassium by flame photometry (Modified Kelowna)	E390 Saskatoon - Environmental	Soil/Solid	Comm. Soil Sci. Plant Anal, 25 (5&6)	Plant available potassium is extracted from soil using modified Kelowna solution. Potassium is determined by flame emission at 770 nm.
Available Sulfate by ICPOES (0.01M Calcium Chloride Ext.)	E497.SO4 Saskatoon - Environmental	Soil/Solid	Alberta Agriculture	Plant available sulfate is determined by ICPOES. Soil is extracted using a 0.01M calcium chloride solution. This extraction may also produce organic sulfur in the extracts when organic soils are analyzed.
BC PHC - EPH by GC-FID	E601A Vancouver - Environmental	Soil/Solid	BC MOE Lab Manual (EPH in Solids by GC/FID) (mod)	Extractable Petroleum Hydrocarbons (EPH) are analyzed by GC-FID.
VOCs (BC List) by Headspace GC-MS	E611C Vancouver - Environmental	Soil/Solid	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
PAHs by Hex:Ace GC-MS (Low Level CCME)	E641A-L Vancouver - Environmental	Soil/Solid	EPA 8270E (mod)	Polycyclic Aromatic Hydrocarbons (PAHs) are analyzed by GC-MS.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Hydrocarbon Utilizing Bacteria	E924.AR  Winnipeg - Environmental	Soil/Solid	Internal	Following extraction, serial dilutions are plated onto hydrocarbon-laden media and incubated at 20°C for 5 days. Observed colonies are enumerated.
Total Organic Carbon (Calculated) in soil	EC356  Saskatoon - Environmental	Soil/Solid	CSSS (2008) 21.2	Total Organic Carbon (TOC) is calculated by the difference between total carbon (TC) and total inorganic carbon (TIC).
LEPH and HEPH: EPH-PAH	EC600A  Vancouver - Environmental	Soil/Solid	BC MOE Lab Manual (LEPH and HEPH) (mod)	Light Extractable Petroleum Hydrocarbons (LEPH) and Heavy Extractable Petroleum Hydrocarbons (HEPH) are calculated as follows: LEPH = Extractable Petroleum Hydrocarbons (EPH10-19) minus Naphthalene and Phenanthrene; HEPH = Extractable Petroleum Hydrocarbons (EPH19-32) minus Benz(a)anthracene, Benzo(b+j+k)fluoranthene, Benzo(a)pyrene, Dibenz(a,h)anthracene, Indeno(1,2,3-cd)pyrene, and Pyrene.
Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Fixed ratio 0.01M Calcium Chloride extraction for plant available nutrients	EP269  Saskatoon - Environmental	Soil/Solid	Alberta Agriculture	Plant available nutrients (N&S) extracted using 0.01M calcium chloride, then shaken well and filtered prior to analysis.
Modified Kelowna Extraction for soil	EP384  Saskatoon - Environmental	Soil/Solid	Comm. Soil Sci. Plant Anal, 25 (5&6)	Plant available phosphorus and potassium are extracted from the soil using fixed ratio Modified Kelowna solution.
VOCs Methanol Extraction for Headspace Analysis	EP581  Vancouver - Environmental	Soil/Solid	EPA 5035A (mod)	VOCs in samples are extracted with methanol. Extracts are then prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
PHCs and PAHs Hexane-Acetone Tumbler Extraction	EP601  Vancouver - Environmental	Soil/Solid	CCME PHC in Soil - Tier 1 (mod)	Samples are subsampled and Petroleum Hydrocarbons (PHC) and PAHs are extracted with 1:1 hexane:acetone using a rotary extractor.
Dry and Grind	EPP442  Saskatoon - Environmental	Soil/Solid	Soil Sampling and Methods of Analysis, Carter 2008	After removal of any coarse fragments and reservation of wet subsamples a portion of homogenized sample is set in a tray and dried at less than 60 C until dry. The sample is then particle size reduced with an automated crusher or mortar and pestle, typically to <2 mm. Further size reduction may be needed for particular tests.

## **General Comments**

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO = Data Quality Objective.

LOR = Limit of Reporting (detection limit).

RPD = Relative Percentage Difference

# = Indicates a QC result that did not meet the ALS DQO.

### Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: Soil/Solid

## Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

## Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

					Laboratory Control Sample (LCS) Report

**Qualifiers**

Qualifier	Description
LCS-ND	Lab Control Sample recovery was slightly outside ALS DQO. Reported non-detect results for associated samples were unaffected.

## Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level  $\geq 1 \times$  spike level.

Sub-Matrix: **Soil/Solid**

## Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be AL long term mean values (for empirical test methods)

Sub Matrix: Soil/Solid

Jeremy Paterson	Analyst	Microbiology, Winnipeg, Manitoba
Melissa Shaw	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Xihua Yao	Laboratory Analyst	Inorganics, Saskatoon, Saskatchewan

## General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances  
LOR: Limit of Reporting (detection limit).

<i>Unit</i>	<i>Description</i>
%	percent
CFU/g	Colony Forming Units per gram
mg/kg	milligrams per kilogram

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "**Preliminary Report**" are considered authorized for use.

## Workorder Comments

Additional parameters added via email for samples , SP20-02-02, SP20-02-04, SP20-02-06, SP20-02-08, SP20-02-10 and SP20-02-12.

## Qualifiers

<i>Qualifier</i>	<i>Description</i>
DLCI	Detection Limit Raised: Chromatographic interference due to co-elution.
DLQ	Detection Limit raised due to co-eluting interference. GCMS qualifier ion ratio did not meet acceptance criteria.

## QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: <b>VA20B4301</b>	Page	: 1 of 16
Client	: <b>Seabridge Gold Inc.</b>	Laboratory	: Vancouver - Environmental
Contact	: Elizabeth Miller	Account Manager	: Selam Worku
Address	: 1235 Main Street P.O. Box 2536 Smithers BC Canada V0J 2N0	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: 416 367 9292	Telephone	: +1 604 253 4188
Project	: VE52655D	Date Samples Received	: 02-Sep-2020 10:45
PO	:	Issue Date	: 28-Sep-2020 11:49
C-O-C number	: ----		
Sampler	: Ardy M		
Site	: ----		
Quote number	: VA20-SEAB100-0003 - Wood/Seabridge Gold		
No. of samples received	: 13		
No. of samples analysed	: 13		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

### Key

**Anonymous:** Refers to samples which are not part of this work order, but which formed part of the QC process lot.  
**CAS Number:** Chemical Abstracts Services number is a unique identifier assigned to discrete substances.  
**DQO:** Data Quality Objective.  
**LOR:** Limit of Reporting (detection limit).  
**RPD:** Relative Percent Difference.

## Summary of Outliers

### **Outliers : Quality Control Samples**

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

### **Outliers: Reference Material (RM) Samples**

- No Reference Material (RM) Sample outliers occur.

### **Outliers : Analysis Holding Time Compliance (Breaches)**

- Analysis Holding Time Outliers exist - please see following pages for full details.

### **Outliers : Frequency of Quality Control Samples**

- No Quality Control Sample Frequency Outliers occur.

RIGHT SOLUTIONS | RIGHT PARTNER

## Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

**Legend & Qualifier Definitions**

EHTR: Exceeded ALS recommended hold time prior to sample receipt.  
 Rec. HT: ALS recommended hold time (see units).

## Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Soil/Solid**

Evaluation: ✖ = QC frequency outside specification; ✔ = QC frequency within specification.

Quality Control Sample Type	Method	QC Lot #	Count		Frequency (%)		Evaluation
			QC	Regular	Actual	Expected	
<b>Analytical Methods</b>							
<b>Laboratory Duplicates (DUP)</b>							
Available Nitrate and Nitrite by Colourimetry (0.01M Calcium Chloride Ext.)	E269.N+N	84477	1	9	11.1	5.0	✔

## Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Moisture Content by Gravimetry	E144 Vancouver - Environmental	Soil/Solid	CCME PHC in Soil - Tier 1	Moisture is measured gravimetrically by drying the sample at 105°C. Moisture content is calculated as the weight loss (due to water) divided by the wet weight of the sample, expressed as a percentage.
Available Nitrate and Nitrite by Colourimetry (0.01M Calcium Chloride Ext.)	E269.N+N Saskatoon - Environmental	Soil/Solid	Alberta Agriculture/APHA 4500-NO3 I (mod)	Plant available nitrate and nitrite are analyzed by colourimetry using a flow injection analyzer on a soil sample extract that has been extracted using 0.01M Calcium Chloride, then shaken well and filtered prior to analysis.
Total Carbon by Combustion	E351 Saskatoon - Environmental	Soil/Solid	CSSS (2008) 21.2 (mod)	Total Carbon is determined by the high temperature combustion method with measurement by an infrared detector.
Total Inorganic Carbon by Acetic Acid pH Standard Curve	E354 Saskatoon - Environmental	Soil/Solid	CSSS (2008) 20.2	Total Inorganic Carbon is determined by acetic acid pH standard curve, where a known quantity of acetic acid is consumed by reaction with carbonates in the soil. The pH of the resulting solution is measured and compared against a standard curve relating pH to weight of carbonate.
Available Phosphorus by FIALab (Modified Kelowna)	E384 Saskatoon - Environmental	Soil/Solid	Comm. Soil Sci. Plant Anal, 25 (5&6)	Plant available phosphorus is extracted from air dried soil using a fixed ratio Modified Kelowna extraction. Phosphorus is determined by colorimetry using a flow injection analyzer.
Available Potassium by flame photometry (Modified Kelowna)	E390 Saskatoon - Environmental	Soil/Solid	Comm. Soil Sci. Plant Anal, 25 (5&6)	Plant available potassium is extracted from soil using modified Kelowna solution. Potassium is determined by flame emission at 770 nm.
Available Sulfate by ICPOES (0.01M Calcium Chloride Ext.)	E497.SO4 Saskatoon - Environmental	Soil/Solid	Alberta Agriculture	Plant available sulfate is determined by ICPOES. Soil is extracted using a 0.01M calcium chloride solution. This extraction may also produce organic sulfur in the extracts when organic soils are analyzed.
BC PHC - EPH by GC-FID	E601A Vancouver - Environmental	Soil/Solid	BC MOE Lab Manual (EPH in Solids by GC/FID) (mod)	Extractable Petroleum Hydrocarbons (EPH) are analyzed by GC-FID.
BTEX by Headspace GC-MS	E611A Vancouver - Environmental	Soil/Solid	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
PAHs by Hex:Ace GC-MS (Low Level CCME)	E641A-L Vancouver - Environmental	Soil/Solid	EPA 8270E (mod)	Polycyclic Aromatic Hydrocarbons (PAHs) are analyzed by GC-MS.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Hydrocarbon Utilizing Bacteria	E924.AR  Winnipeg - Environmental	Soil/Solid	Internal	Following extraction, serial dilutions are plated onto hydrocarbon-laden media and incubated at 20°C for 5 days. Observed colonies are enumerated.
Total Organic Carbon (Calculated) in soil	EC356  Saskatoon - Environmental	Soil/Solid	CSSS (2008) 21.2	Total Organic Carbon (TOC) is calculated by the difference between total carbon (TC) and total inorganic carbon (TIC).
LEPH and HEPH: EPH-PAH	EC600A  Vancouver - Environmental	Soil/Solid	BC MOE Lab Manual (LEPH and HEPH) (mod)	Light Extractable Petroleum Hydrocarbons (LEPH) and Heavy Extractable Petroleum Hydrocarbons (HEPH) are calculated as follows: LEPH = Extractable Petroleum Hydrocarbons (EPH10-19) minus Naphthalene and Phenanthrene; HEPH = Extractable Petroleum Hydrocarbons (EPH19-32) minus Benz(a)anthracene, Benzo(b+j+k)fluoranthene, Benzo(a)pyrene, Dibenz(a,h)anthracene, Indeno(1,2,3-cd)pyrene, and Pyrene.
Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Fixed ratio 0.01M Calcium Chloride extraction for plant available nutrients	EP269  Saskatoon - Environmental	Soil/Solid	Alberta Agriculture	Plant available nutrients (N&S) extracted using 0.01M calcium chloride, then shaken well and filtered prior to analysis.
Modified Kelowna Extraction for soil	EP384  Saskatoon - Environmental	Soil/Solid	Comm. Soil Sci. Plant Anal, 25 (5&6)	Plant available phosphorus and potassium are extracted from the soil using fixed ratio Modified Kelowna solution.
VOCs Methanol Extraction for Headspace Analysis	EP581  Vancouver - Environmental	Soil/Solid	EPA 5035A (mod)	VOCs in samples are extracted with methanol. Extracts are then prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
PHCs and PAHs Hexane-Acetone Tumbler Extraction	EP601  Vancouver - Environmental	Soil/Solid	CCME PHC in Soil - Tier 1 (mod)	Samples are subsampled and Petroleum Hydrocarbons (PHC) and PAHs are extracted with 1:1 hexane:acetone using a rotary extractor.
Dry and Grind	EPP442  Saskatoon - Environmental	Soil/Solid	Soil Sampling and Methods of Analysis, Carter 2008	After removal of any coarse fragments and reservation of wet subsamples a portion of homogenized sample is set in a tray and dried at less than 60 C until dry. The sample is then particle size reduced with an automated crusher or mortar and pestle, typically to <2 mm. Further size reduction may be needed for particular tests.

## **General Comments**

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO = Data Quality Objective.

LOR = Limit of Reporting (detection limit).

RPD = Relative Percentage Difference

# = Indicates a QC result that did not meet the ALS DQO.

## Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: Soil/Solid

## Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

## Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: Soil/Solid

### Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level  $\geq$  1x spike level.

Sub-Matrix: **Soil/Solid**

					Matrix Spike (MS) Report					
					Spike		Recovery (%)	Recovery Limits (%)		
Laboratory sample ID	Client sample ID	Analyte	CAS Number	Method	Concentration	Target	MS	Low	High	Qualifier
<b>Volatile Organic Compounds (QCLot: 82438)</b>										
VA20B4301-002	SP20-02-02	benzene	71-43-2	E611A	2.12 mg/kg	3.125 mg/kg	99.6	60 0	140	----
		ethylbenzene	100-41-4	E611A	2.00 mg/kg	3.125 mg/kg	94.3	60 0	140	----
		methyl-tert-butyl ether [MTBE]	1634-04-4	E611A	2.17 mg/kg	3.125 mg/kg	102	60 0	140	----
		styrene	100-42-5	E611A	1.98 mg/kg	3.125 mg/kg	93.4	60 0	140	----
		toluene	108-88-3	E611A	2.02 mg/kg	3.125 mg/kg	94.8	60 0	140	----

		xylene, o-	95-47-6	E611A	2.06 mg/kg	3.125 mg/kg	96.8	60 0	140	----

## Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be AL long term mean values (for empirical test methods)

Sub Matrix: Soil/Solid

					Reference Material (RM) Report				
Laboratory sample ID	Reference Material ID	Analyte	CAS Number	Method	RM Target Concentration	Recovery (%) RM	Recovery Limits (%)		Qualifier
							Low	High

No. of samples received : 9
No. of samples analysed : 9

Page : 1 of 10
Laboratory : Vancouver - Environmental
Account Manager : Selam Worku
Address : 8081 Lougheed Highway
Burnaby BC Canada V5A 1W9
Telephone : +1 604 253 4188
Date Samples Received : 28-Aug-2020 10:10
Date Analysis Commenced : 01-Sep-2020
Issue Date : 27-Oct-2020 09:43

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
Analytical Results
Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Table with 3 columns: Signatories, Position, Laboratory Department. Lists names like Annabelle Prasad, Bruna Botti, Caitlin Macey, Cristina Alexandre, Kevin Duarte, Lindsay Gung, Ophelia Chiu, Shaneel Dayal and their respective roles and departments.

## General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances  
LOR: Limit of Reporting (detection limit).

<i>Unit</i>	<i>Description</i>
-	No Unit
µg/L	micrograms per litre
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

## Workorder Comments

**Sample "BH17-20B": 2 40mL glass VOC vials received broken. BTEX analysis not possible.**

**All Samples: Labelling Issues. On CofC, Sample IDs start with "BH17" but on bottles Sample IDs start with "MW17". Samples labelled as per CofC.**

The units for trace metals have been updated to ug/L in this report.

## Qualifiers

<i>Qualifier</i>	<i>Description</i>
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).

## QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: <b>VA20B3887</b>	Page	: 1 of 21
Amendment	: 1		
Client	: <b>Wood Canada Ltd.</b>	Laboratory	: Vancouver - Environmental
Contact	: Jeremiah Gladu	Account Manager	: Selam Worku
Address	: 600 - 4445 Lougheed Hwy Burnaby BC Canada V5C 0E4	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: VE52655D	Date Samples Received	: 28-Aug-2020 10:10
PO	: ----	Issue Date	: 27-Oct-2020 09:43
C-O-C number	: ----		
Sampler	: Ardy M.		
Site	: ----		
Quote number	: VA20-SEAB100-0003 - Wood/Seabridge Gold		
No. of samples received	: 9		
No. of samples analysed	: 9		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

### Key

**Anonymous:** Refers to samples which are not part of this work order, but which formed part of the QC process lot.

**CAS Number:** Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

**DQO:** Data Quality Objective.

**LOR:** Limit of Reporting (detection limit).

**RPD:** Relative Percent Difference.

## Summary of Outliers

### **Outliers : Quality Control Samples**

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

### **Outliers: Reference Material (RM) Samples**

- No Reference Material (RM) Sample outliers occur.

### **Outliers : Analysis Holding Time Compliance (Breaches)**

- Analysis Holding Time Outliers exist - please see following pages for full details.

### **Outliers : Frequency of Quality Control Samples**

- No Quality Control Sample Frequency Outliers occur.

## Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

**Legend & Qualifier Definitions**

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended  
 EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.  
 Rec. HT: ALS recommended hold time (see units).

## Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water** Evaluation: ✖ = QC frequency outside specification; ✔ = QC frequency within specification.

Quality Control Sample Type	Method	QC Lot #	Count		Frequency (%)		Evaluation
			QC	Regular	Actual	Expected	
<b>Analytical Methods</b>							
<b>Laboratory Duplicates (DUP)</b>							
Acidity by Titration	E283	79843	1	7	14.2	5.0	✔
Alkalinity Species by Titration	E290	79835	1	19	5.2	5.0	✔
Ammonia by Fluorescence	E298	80950	1	18	5.5	5.0	✔

## Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Acidity by Titration	E283  Vancouver - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to a specified endpoint.
Alkalinity Species by Titration	E290  Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298  Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Dissolved Metals in Water by CRC ICPMS	E421  Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS.  Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L  Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Dissolved Mercury in Water by CVAAS	E509  Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
BC PHC - EPH by GC-FID	E601A  Vancouver - Environmental	Water	BC MOE Lab Manual	Extractable Petroleum Hydrocarbons (EPH) are analyzed by GC-FID.
BTEX by Headspace GC-MS	E611A  Vancouver - Environmental	Water	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
PAHs by Hexane LVI GC-MS	E641A  Vancouver - Environmental	Water	EPA 8270E (mod)	Polycyclic Aromatic Hydrocarbons (PAHs) are analyzed by large volume injection (LVI) GC-MS.
Dissolved Hardness (Calculated)	EC100  Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO <sub>3</sub> ), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO <sub>3</sub> equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.

<i>Analytical Methods</i>	<i>Method / Lab</i>	<i>Matrix</i>	<i>Method Reference</i>	<i>Method Descriptions</i>
LEPH and HEPH: EPH-PAH	EC600A  Vancouver - Environmental	Water	BC MOE Lab Manual (LEPH and HEPH) (mod)	Light Extractable Petroleum Hydrocarbons (LEPH) and Heavy Extractable Petroleum Hydrocarbons (HEPH) are calculated as follows: LEPH = Extractable Petroleum Hydrocarbons (EPH10-19) minus Acenaphthene, Acridine, Anthracene, Fluorene, Naphthalene and Phenanthrene; HEPH = Extractable Petroleum Hydrocarbons (EPH19-32) minus Benz(a)anthracene, Benzo(a)pyrene, Fluoranthene, and Pyrene.
<i>Preparation Methods</i>	<i>Method / Lab</i>	<i>Matrix</i>	<i>Method Reference</i>	<i>Method Descriptions</i>
Dissolved Metals Water Filtration	EP421  Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO <sub>3</sub> .
Dissolved Mercury Water Filtration	EP509  Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.
VOCs Preparation for Headspace Analysis	EP581  Vancouver - Environmental	Water	EPA 5021A (mod)	Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler. An aliquot of the headspace is then injected into the GC/MS-FID system.
PHCs and PAHs Hexane Extraction	EP601  Vancouver - Environmental	Water	EPA 3511 (mod)	Petroleum Hydrocarbons (PHCs) and Polycyclic Aromatic Hydrocarbons (PAHs) are extracted using a hexane liquid-liquid extraction.

## QUALITY CONTROL REPORT

**Work Order** : **VA20B3887**

**Page** : 1 of 15

**Amendment** : **1**

**Client** : Wood Canada Ltd.  
**Contact** : Jeremiah Gladu  
**Address** : 1235 Main Street P.O. Box 2536  
 Smithers BC Canada V0J 2N0

**Laboratory** : Vancouver - Environmental  
**Account Manager** : Selam Worku  
**Address** : 8081 Lougheed Highway  
 Burnaby, British Columbia Canada V5A 1W9

**Telephone** : ----  
**Project** : VE52655D

**No. of samples received** : 9  
**No. of samples analysed** : 9

**Telephone** : +1 604 253 4188  
**Date Samples Received** : 28-Aug-2020 10:10  
**Date Analysis Commenced** : 01-Sep-2020  
**Issue Date** : 27-Oct-2020 09:43

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

### Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

## General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO = Data Quality Objective.

LOR = Limit of Reporting (detection limit).

RPD = Relative Percentage Difference

# = Indicates a QC result that did not meet the ALS DQO.

## Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

## Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

## Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

## Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Laboratory : Vancouver - Environmental
Account Manager : Selam Worku
Address : 8081 Lougheed Highway
Burnaby BC Canada V5A 1W9
Telephone : +1 604 253 4188
Date Samples Received : 28-Aug-2020 10:10
Date Analysis Commenced : 28-Aug-2020
Issue Date : 27-Oct-2020 16:09

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
Analytical Results
Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Table with 3 columns: Signatories, Position, Laboratory Department. Lists names like Brianna Allen, Bruna Botti, Caitlin Macey, etc., along with their roles and departments.

## General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances  
LOR: Limit of Reporting (detection limit).

<i>Unit</i>	<i>Description</i>
-	No Unit
µg/L	micrograms per litre
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

## Workorder Comments

Samples "BH17-04B" & "BH17-07A" One VOC vials received broken in Transit.

## Qualifiers

<i>Qualifier</i>	<i>Description</i>
DLCI	Detection Limit Raised: Chromatographic interference due to co-elution.
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
RRV	Reported result verified by repeat analysis.

## QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: <b>VA20B3890</b>	Page	: 1 of 16
Amendment	: 1		
Client	: <b>Wood Canada Ltd.</b>	Laboratory	: Vancouver - Environmental
Contact	: Jeremiah Gladu	Account Manager	: Selam Worku
Address	: 600 - 4445 Lougheed Hwy Burnaby BC Canada V5C 0E4	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: VE52655D	Date Samples Received	: 28-Aug-2020 10:10
PO	: ----	Issue Date	: 27-Oct-2020 16:09
C-O-C number	: ----		
Sampler	: Ardy M.		
Site	: ----		
Quote number	: VA20-SEAB100-0003 - Wood/Seabridge Gold		
No. of samples received	: 7		
No. of samples analysed	: 7		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

### Key

**Anonymous:** Refers to samples which are not part of this work order, but which formed part of the QC process lot.

**CAS Number:** Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

**DQO:** Data Quality Objective.

**LOR:** Limit of Reporting (detection limit).

**RPD:** Relative Percent Difference.

## Summary of Outliers

### Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- Test sample Surrogate recovery outliers exist for all regular sample matrices - please see following pages for full details.

### Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

### Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

### Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Page : 3 of 16  
Work Order : VA20B3890 Amendment 1  
Client : Wood Canada Ltd.

**Regular Sample Surrogates**

Sub-Matrix: **Groundwater**

Analyte Group	Laboratory sample ID	Client/Ref Sample D	Analyte	CAS Number	Result	Limits	Comment
<b>Samples Submitted</b>							
Polycyclic Aromatic Hydrocarbons Surrogates	VA20B3890-004	BH17-06A	acridine-d9	34749-75-2	7.09 %	60.0-130 %	Recovery less than lower data quality objective

## Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Matrix: **Water** Evaluation: \* = Holding time exceedance ; ✓ = Within Holding Time

**Legend & Qualifier Definitions**

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

Rec. HT: ALS recommended hold time (see units).

## Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water** Evaluation: \* = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type	Method	QC Lot #	Count		Frequency (%)		Evaluation
			QC	Regular	Actual	Expected	
<b>Analytical Methods</b>							
<b>Laboratory Duplicates (DUP)</b>							
Acidity by Titration	E283	78895	1	16	6.2	5.0	✓

## Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Vancouver - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to a specified endpoint.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS.  Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
BC PHC - EPH by GC-FID	E601A Vancouver - Environmental	Water	BC MOE Lab Manual	Extractable Petroleum Hydrocarbons (EPH) are analyzed by GC-FID.
BTEX by Headspace GC-MS	E611A Vancouver - Environmental	Water	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
PAHs by Hexane LVI GC-MS	E641A Vancouver - Environmental	Water	EPA 8270E (mod)	Polycyclic Aromatic Hydrocarbons (PAHs) are analyzed by large volume injection (LVI) GC-MS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO <sub>3</sub> ), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO <sub>3</sub> equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
LEPH and HEPH: EPH-PAH	EC600A Vancouver - Environmental	Water	BC MOE Lab Manual (LEPH and HEPH) (mod)	Light Extractable Petroleum Hydrocarbons (LEPH) and Heavy Extractable Petroleum Hydrocarbons (HEPH) are calculated as follows: LEPH = Extractable Petroleum Hydrocarbons (EPH10-19) minus Acenaphthene, Acridine, Anthracene, Fluorene, Naphthalene and Phenanthrene; HEPH = Extractable Petroleum Hydrocarbons (EPH19-32) minus Benz(a)anthracene, Benzo(a)pyrene, Fluoranthene, and Pyrene.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
---------------------	--------------	--------	------------------	---------------------

<i>Preparation Methods</i>	<i>Method / Lab</i>	<i>Matrix</i>	<i>Method Reference</i>	<i>Method Descriptions</i>
Dissolved Metals Water Filtration	EP421  Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO <sub>3</sub> .
Dissolved Mercury Water Filtration	EP509  Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.
VOCs Preparation for Headspace Analysis	EP581  Vancouver - Environmental	Water	EPA 5021A (mod)	Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler. An aliquot of the headspace is then injected into the GC/MS-FID system.
PHCs and PAHs Hexane Extraction	EP601  Vancouver - Environmental	Water	EPA 3511 (mod)	Petroleum Hydrocarbons (PHCs) and Polycyclic Aromatic Hydrocarbons (PAHs) are extracted using a hexane liquid-liquid extraction.

 Issue Date : 27-Oct-2020 16:09

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

### *Signatories*

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Shaneel Dayal	Analyst	Metals, Burnaby, British Columbia

## General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO = Data Quality Objective.

LOR = Limit of Reporting (detection limit).

RPD = Relative Percentage Difference

# = Indicates a QC result that did not meet the ALS DQO.

### Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

## Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

## Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

### Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

**Signatories**

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Cristina Alexandre	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Harsha Attanayake	Laboratory Analyst	Organics, Burnaby, British Columbia
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Ophelia Chiu	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia
Shaneel Dayal	Analyst	Metals, Burnaby, British Columbia

## General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances  
LOR: Limit of Reporting (detection limit).

<i>Unit</i>	<i>Description</i>
-	No Unit
µg/L	micrograms per litre
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

## Workorder Comments

Sample "BH17-17A" VOC vials received broken in Transit.

## Qualifiers

<i>Qualifier</i>	<i>Description</i>
DLCI	Detection Limit Raised: Chromatographic interference due to co-elution.
RRV	Reported result verified by repeat analysis.

Quote number	: VA20-SEAB100-0003 - Wood/Seabridge Gold		
No. of samples received	: 9		
No. of samples analysed	: 8		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

### Key

**Anonymous:** Refers to samples which are not part of this work order, but which formed part of the QC process lot.

**CAS Number:** Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

**DQO:** Data Quality Objective.

**LOR:** Limit of Reporting (detection limit).

**RPD:** Relative Percent Difference.

## Summary of Outliers

### **Outliers : Quality Control Samples**

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- Test sample Surrogate recovery outliers exist for all regular sample matrices - please see following pages for full details.

### **Outliers: Reference Material (RM) Samples**

- No Reference Material (RM) Sample outliers occur.

### **Outliers : Analysis Holding Time Compliance (Breaches)**

- Analysis Holding Time Outliers exist - please see following pages for full details.

### **Outliers : Frequency of Quality Control Samples**

- No Quality Control Sample Frequency Outliers occur.

**Regular Sample Surrogates**

Sub-Matrix: **Groundwater**

Analyte Group	Laboratory sample ID	Client/Ref Sample D	Analyte	CAS Number	Result	Limits	Comment
<b>Samples Submitted</b>							
Polycyclic Aromatic Hydrocarbons Surrogates	VA20B3891-002	BH17-12B	acridine-d9	34749-75-2	23.0 %	60.0-130 %	Recovery less than lower data quality objective
Polycyclic Aromatic Hydrocarbons Surrogates	VA20B3891-009	BH17-62B	acridine-d9	34749-75-2	44.1 %	60.0-130 %	Recovery less than lower data quality objective

## Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

**Legend & Qualifier Definitions**

- EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended
- EHTR: Exceeded ALS recommended hold time prior to sample receipt.
- EHT: Exceeded ALS recommended hold time prior to analysis.
- Rec. HT: ALS recommended hold time (see units).

## Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water** Evaluation: \* = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type	Method	QC Lot #	Count		Frequency (%)		Evaluation
			QC	Regular	Actual	Expected	
<b>Analytical Methods</b>							
<b>Laboratory Duplicates (DUP)</b>							
Acidity by Titration	E283	78895	1	16	6.2	5.0	✓
Alkalinity Species by Titration	E290	78897	1	16	6.2	5.0	✓
Ammonia by Fluorescence	E298	80951	1	14	7.1	5.0	✓

## Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Vancouver - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to a specified endpoint.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS.  Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
