## EXECUTIVE SUMMARY

The Johnny Mountain Mine (JMM) is a closed underground gold mine located in the Coast Mountain Range of British Columbia (BC), approximately 100 km northwest of Stewart, BC. It has been closed since 1993, and reclamation activities took place sporadically on the site from 1999 to 2015. In 2016 Seabridge Gold Inc. acquired SnipGold Corp. and their associated properties, and commenced annual reclamation activities in addition to on-going permit compliance programs. Currently there are three provincial permits associated with the site: *Mines Act* Reclamation Permit M-178, *Environmental Management Act* Permit PE-8415, and *Environmental Management Act* Permit PR-7927. The Johnny Mountain Mine site, along with surrounding mineral tenures and the Bronson Airstrip, comprise Seabridge Gold Inc.'s Iskut Project. SnipGold continues to carry out an exploration program on the property under *Mines Act* Permit MX-1-46.

The overall land use objective of the reclamation plan is to return disturbed lands and new anthropogenic landforms to alpine tundra wildlife habitat. Permit M-178 stipulates that the average land capability to be achieved should not be less than the average that existed pre-mining.

Returning the area to its original land use will be accomplished by meeting the following objectives, as outlined in the *Closure Plan for the Johnny Mountain Gold Mine, Reclamation Permit No. M-178* (Woznow and Yeager 1999):

- develop a closure scenario that prevents potential impacts to surface and groundwater resources;
- restore the natural appearance of the area after mining ceases through the re-contouring and re-vegetation of disturbed lands and anthropogenic landforms;
- ensure that disturbances and re-developed landforms are stable from a long-term geotechnical and geochemical perspective;
- re-vegetate the site through the development of self-sustaining natural succession processes; and
- develop landforms and vegetative cover that provide a stable and productive wildlife habitat for resident and transient species utilizing the area.

### 2020 Environmental Protection (Environmental and Engineering) Activities

Due to the COVID-19 pandemic in 2020 and the associated health and safety risks, activities outlined in the 2020 Project Execution Plan for the Johnny Mountain Mine site were deferred. On site activities in 2020 were limited to compliance related requirements associated with SnipGold's *Mines Act* Permit M178, *Environmental Management Act* (EMA) Permit PR-7927, and EMA Permit PE-8415, as well as a small exploration drill program. The following Environmental Protection (Environmental and Engineering) activities took place in 2020:

- completion of the compliance surface water quality monitoring program for EMA Permit PE-8415;
- completion of the compliance groundwater and surface water quality monitoring program for BC EMA Permit PR-7927;
- operation and maintenance of the Johnny Mountain meteorological station located approximately 400 m west of the tailings storage facility (TSF);
- hydrologic monitoring of TSF seepage at two stations and manual measurements of flows at level 10, level 11, and level 12 portals;
- groundwater level and groundwater quality sampling; and

- monitoring of vegetation trials on the decommissioned airstrip.

### 2020 Reclamation Program

A dam safety inspection was conducted on August 20, 2020 by Engineer of Record (EoR) Neil K. Hemrajani Singh, P.Eng. of Klohn Crippen Berger (KCB) and representatives of SnipGold (TSF Qualified Person Elizabeth Miller and the SnipGold representatives Jessy Chaplin, and Lionel Sequeira). In addition site inspections were conducted by Kevin Hidber of SnipGold on June 17, 2020 and August 1, 2020.

In 2020 Wood PLC (Wood) continued the environmental site investigation of areas of potential environmental concern (APECs) and areas of environmental concern (AECs). In 2020, to limit exposure from the COVID-19 virus, heavy equipment was not available at the Site for investigations, excavation of hydrocarbon contaminated soil for further soil remediation or mechanical aeration of treatment areas. The modified 2020 objectives to support ongoing Site reclamation work included:

- Continue to assess hydrocarbon impacts in groundwater within APECs/AECs;
- Evaluation of petroleum hydrocarbon levels in material located in the Treatment Areas 1 and 2;
- Continuing evaluation of background concentration of metals in groundwater; and
- Collection of surface water and groundwater samples.

### Planned Reclamation Activities

Achieving the approved closure and reclamation objectives will remain the priority of SnipGold. SnipGold will continue to develop detailed Project Execution Plans for each year of activity. The key objectives for reclamation include:

- Removal of infrastructure and cleanup of the JMM site;
- Relocation to TSF water cover of potentially acid generating waste rock remaining at Portals #10, 11, 12, and isolated pockets from the decommissioned airstrip and secondary roads;
- Decompact disturbed lands to enable development of natural habitat for wildlife utilization; and
- Establish long-term biological, geotechnical and geochemical stability of restored areas.

Through this time SnipGold will maintain a controlled, safe and secure site, where safety and safe work practices are of paramount importance.

The primary goal of the 2021 season is the excavation and relocation of PAG waste rock from the Level 10, 11, 12 portals, as well as isolated pockets of PAG waste rock located on the JMM airstrip and secondary access roads. All excavated waste rock will be mixed with hydrated lime to add neutralization potential and prevent the release of dissolved metals as the waste rock is placed below water cover inside the TSF.

Complete reclamation and closure of the JMM Site is anticipated within the next few years. This will be achieved through sequenced decommissioning of remaining on site infrastructure, complete PAG waste rock relocation to the TSF, continue in-situ soil remediation, removal of waste materials from the surface of the site, disposal of inert materials in the site landfill, site grading, and subsequent re-vegetation of target areas as identified in Section 4.1.2 above.

Environmental programs and monitoring required through the JMM permits (i.e., *Mines Act* Reclamation Permit M-178, *EMA* Permit PE-8415, and *EMA* Permit PR-7927) will continue at JMM in 2021, and annual reports documenting associated activities will be provided.

SnipGold will continue to implement management and monitoring plans required for the JMM site, for example the Metal Leaching/Acid Rock Drainage (ML/ARD) Monitoring Plan, Closure Management Manual, Drainage Management Plan and others.

#### Outstanding Reclamation Liability

The total expenditures in 2020 were [REDACTED]. The net outstanding reclamation liability estimate is [REDACTED]. This is based on the 2018 estimate (prepared to an ACE Class 2 Construction Cost Estimate level, with an expected accuracy range of 10%/+20%).

TRCR	The British Columbia Technical and Research Committee on Reclamation
TSF	Tailings Storage Facility. Referred to as the Tailings Impoundment or Tailings Pond in Permit PE-8415, referred to as the Tailings Storage Facility in Permit M-178.
VPH	Volatile petroleum hydrocarbons
VOCs	Volatile organic compounds
WAD	Weak acid dissociable

## 1. INTRODUCTION

### 1.1 History of the Project

The Johnny Mountain Mine (JMM) is a closed underground gold mine located in the Coast Mountain Range of British Columbia (BC), approximately 100 km northwest of Stewart, BC.

The underground mine has been closed since 1993, and reclamation activities took place sporadically on the site from 1999 to 2015. In 2016 Seabridge Gold Inc. acquired SnipGold Corp. (SnipGold) and their associated properties, and commenced annual reclamation activities. SnipGold is a subsidiary of Seabridge Gold Inc. Currently there are three provincial permits associated with the site: *Mines Act* Reclamation Permit M-178, *EMA* Permit PE-8415 (Permit PE-8415) (amended June 2019; Appendix A), and *EMA* Permit PR-7927 (Permit PR-7927) (amended on April 17, 2019; Appendix A). The Johnny Mountain Mine site, along with surrounding mineral tenures and the Bronson Airstrip, comprise Seabridge Gold Inc.'s Iskut Project.

The site began development in 1986 and mining operations were conducted from 1988 to 1990. There was also a three-month operating period in 1993. The milling process was comprised of conventional grinding and gravity separation. A cyanide leach process was initially included in the mill design. Due to inefficiencies, the cyanide leach process was decommissioned early on during active mining operations (prior to the 1990 shutdown).

Since acquiring the property, SnipGold has conducted site closure, remediation and monitoring work to ensure compliance with existing authorizations and to implement remediation programs to effectively mitigate the impacts of historical mining activity. A formal closure plan under Permit M-178 was developed and accepted by the British Columbia Ministry of Energy and Mines in 1999; *Closure Plan for the Johnny Mountain Gold Mine* (Woznow and Yeager 1999). In March 2020, SnipGold submitted to the Ministry of Energy, Mines and Petroleum Resources (EMPR) an updated Mine Reclamation and Closure Plan, and Closure Management Manual to address Condition 3(b) of the *Mines Act* Permit M-178. These documents are currently in review by the EMLI. SnipGold also continues to carry out an exploration program on the property.

### 1.2 Location and Access

The Johnny Mountain Mine site is located approximately 100 km northwest of Stewart, BC (Figure 1.2-1). The site is situated on a sub-alpine plateau surrounded by steep valleys, and is located near the confluence of the Craig and Iskut Rivers. The northwest face of Johnny Mountain is covered by an alpine glacier. The Johnny Mountain Mine site dimensions are approximately 700 m by 1,000 m. The site is legally described as District Lots 7031 and 7032, Cassiar District.

Currently, exploration and reclamation activities are staged from the Bronson airstrip. The Bronson airstrip and camp are currently only accessible by fixed wing aircraft or by helicopter. Access to the closed mine site is via helicopter or by driving 10 km along an access road from the Bronson airstrip. There is a decommissioned airstrip at the Johnny Mountain Mine site.

### 1.3 General Setting

The former mine site is situated on a sub-alpine plateau at approximately 1,100 m elevation. Above the plateau are glaciers on Johnny Mountain, which feed streams that run through and around the site. Much of the site above the decommissioned airstrip is located on morainal till deposits exposed by the receding glacier. The deglaciated areas typically have limited, if any, soil development; where present, soils are derived from glacial till and colluvium. Terrain falls off steeply around the plateau, with glacier-fed streams falling in cascades surrounding the plateau. The site is surrounded by treed, steep valleys.

The climate at the site is typical of an alpine tundra site located near the Pacific Coast. Winters include heavy snowfall and cold temperatures, and rain is common during the rest of the year. A meteorology station was installed on the plateau in September 2016, and this station collects local data including wind speed, wind direction, temperature, humidity, solar radiation, snow depth, and precipitation. A summary of the meteorological data collected in 2020 is provided in Appendix B (RTEC 2021a).

Three main streams originate and drain from the plateau: Johnny Creek (drains to the north-northeast, and enters Bronson Creek); Stonehouse Creek (drains to the southwest, and enters the Craig River); and Sky Creek (drains to the northwest, and enters the Craig River). Below the plateau Bronson Creek drains to the Iskut River. Stonehouse Creek and Sky Creek drain into the Craig River, then into the Iskut River, which eventually drains into the Stikine River, which flows west to the Pacific Ocean. There are fish barriers on Johnny Creek (at the confluence with Bronson Creek), Stonehouse Creek (3 km downstream of the mine), and Sky Creek (4 km downstream of the mine), which prevent fish from accessing the site (RTEC 2017a, 2017b).

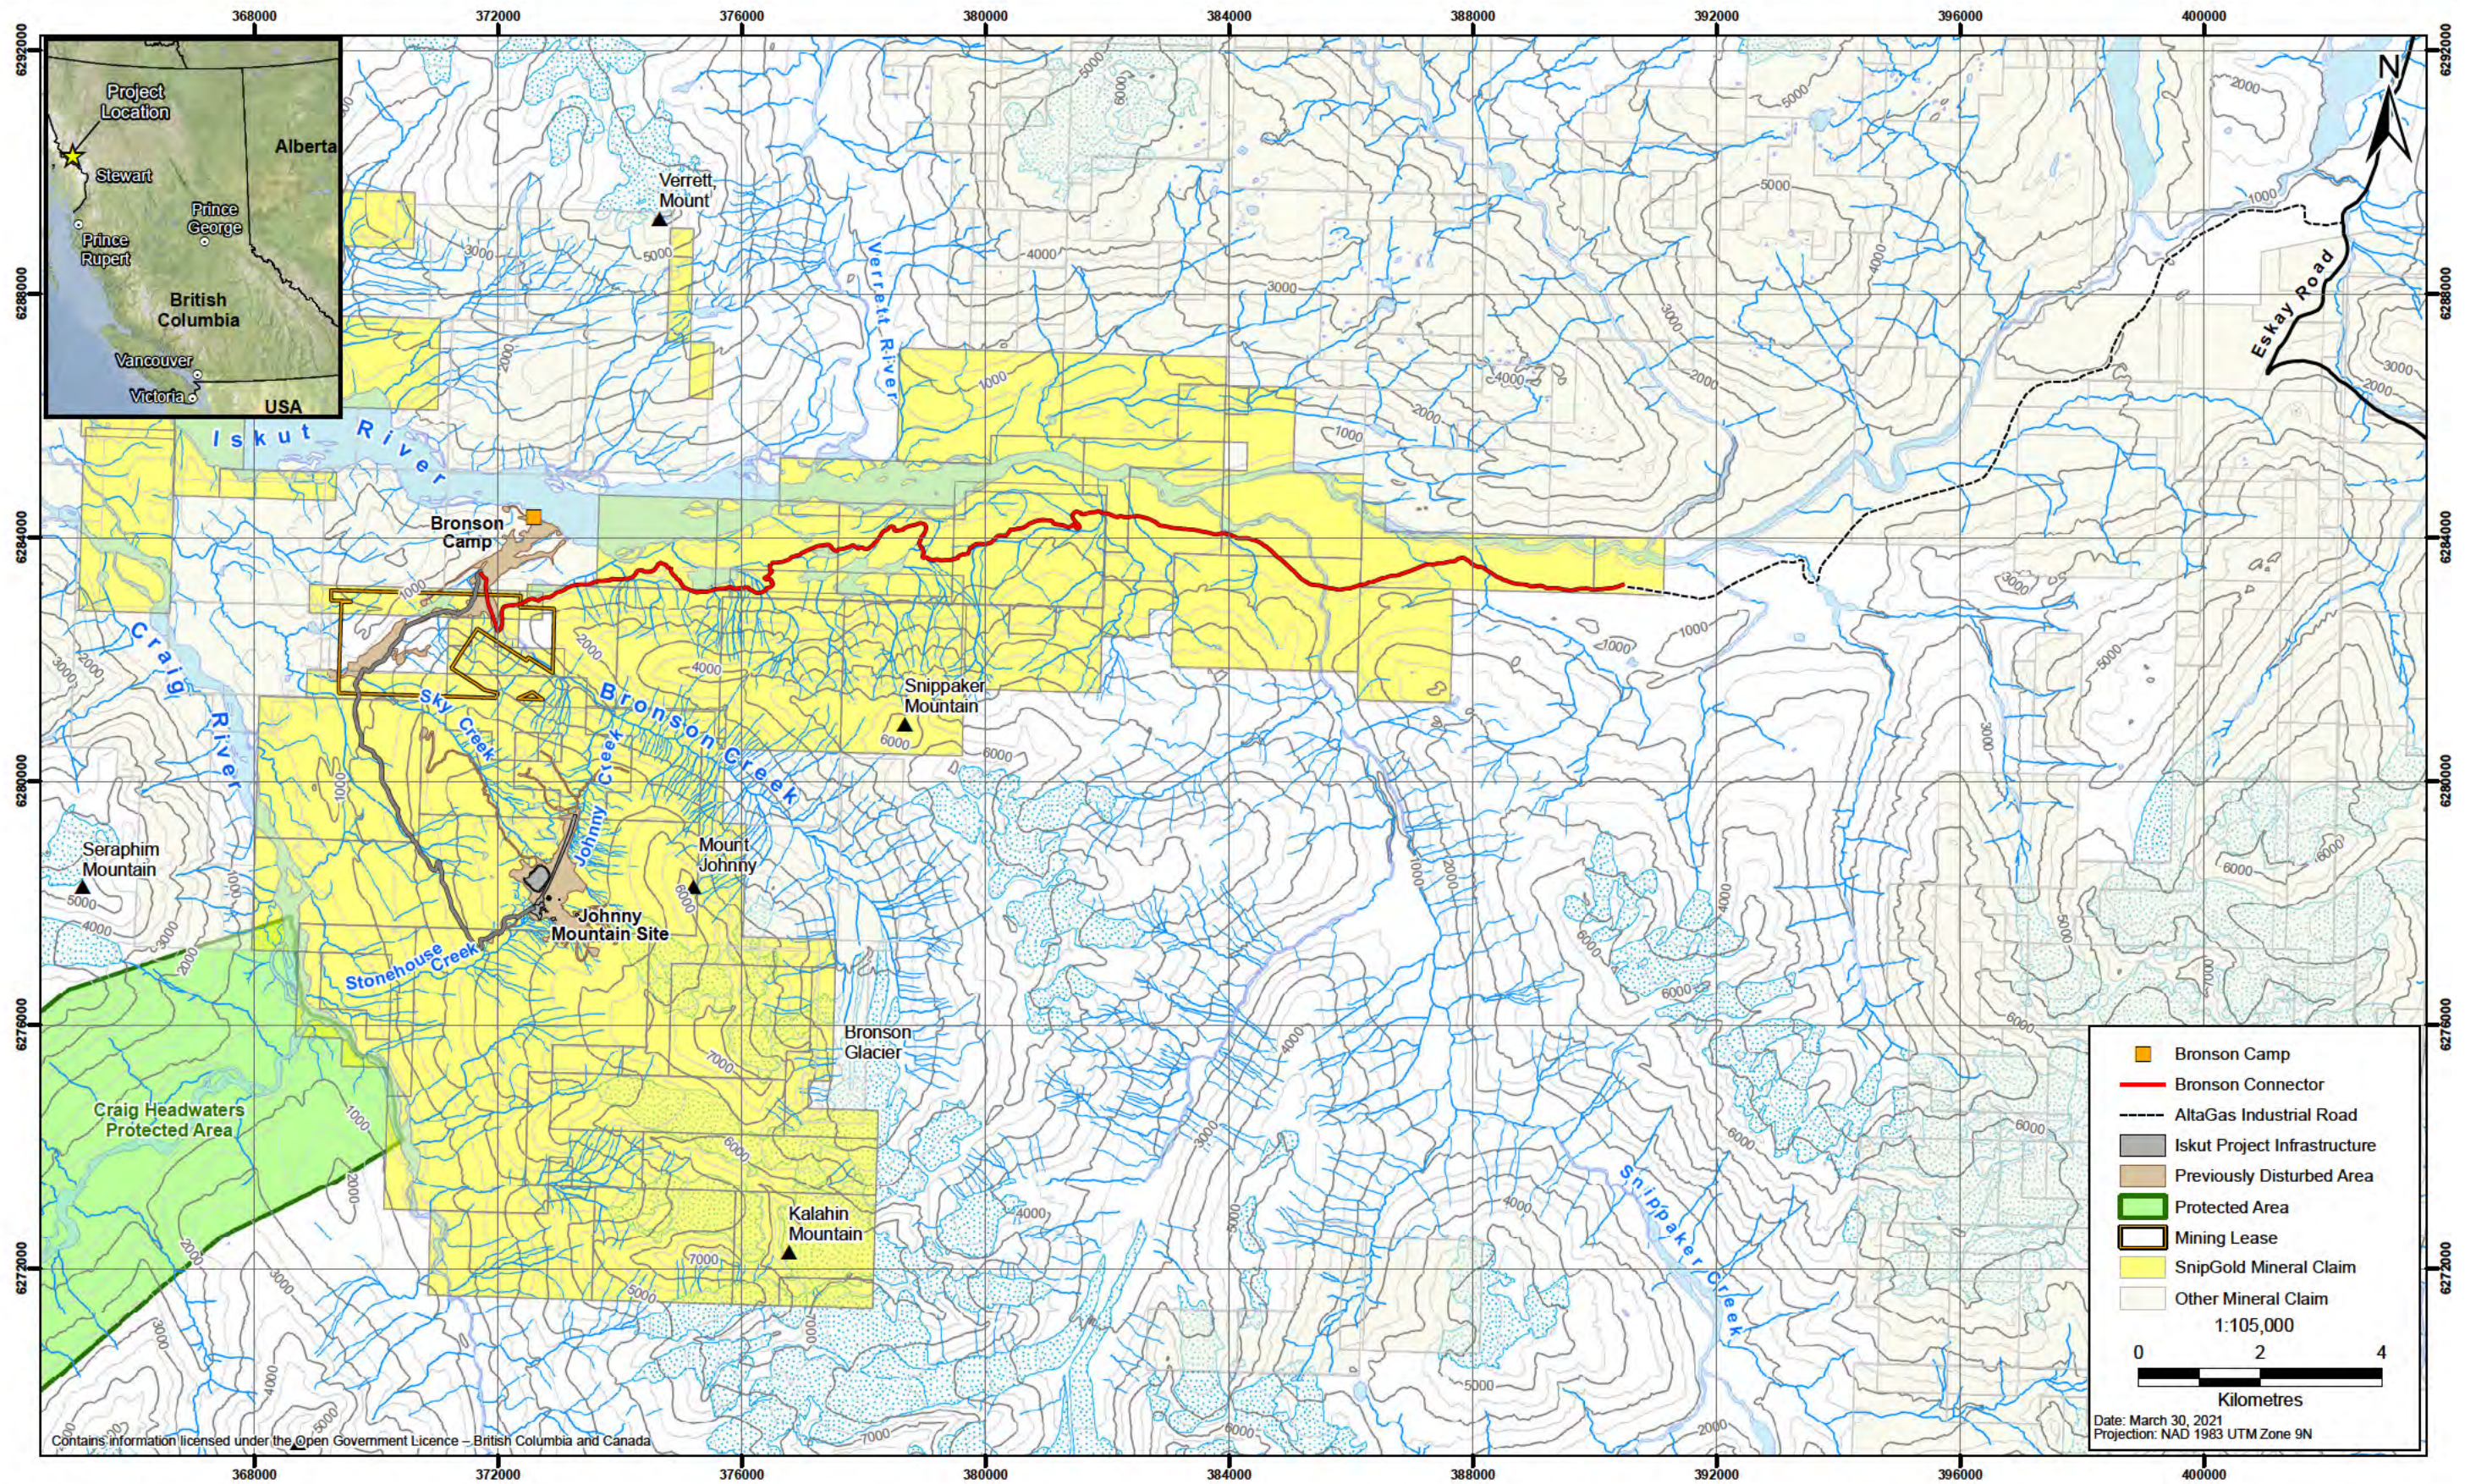

Downstream of the fish barriers below the plateau, fish species known to inhabit the regional watersheds of the area include Dolly Varden (*Salvelinus malma*), Cutthroat Trout (*Oncorhynchus clarkii*), Rainbow Trout/steelhead (*O. mykiss*), Coho Salmon (*O. kisutch*), Chinook Salmon (*O. tshawytscha*), Sockeye Salmon (*O. nerka*), Pink Salmon (*O. gorbuscha*), Chum Salmon (*O. keta*), Coastrange Sculpin (*Cottus aleuticus*), Prickly Sculpin (*C. asper*), and Mountain Whitefish (*Prosopium williamsoni*) (BC MOE 2009). Fish captured in Bronson Creek, lower Stonehouse Creek, lower Sky Creek, and surrounding reference stations in 2016 included Dolly Varden, Bull Trout, Mountain Whitefish, Coastrange Sculpin, Coho Salmon, Cutthroat Trout, and Chinook Salmon (RTEC 2017b).

The Biogeoclimatic (BGC) units include the Coastal Western Hemlock Wet Submaritime Subzone Montane Variant (CWHws2) that occurs from 600 to 1,000 m elevation, Moist Maritime Subzone Leeward Variant (MHmm2) that extends from 800 m to 1,800 m in elevation, MHmm2 parkland that is comprised of open subalpine meadows and tree clumps, and Coastal Mountain-heather Alpine (CMA) above the treeline. These BGC units support mature forests, wetlands, alpine areas, and riparian forests that provide habitat to a diverse wildlife community. Common species or groups that occur regionally include ungulates (e.g., moose, mountain goat), omnivores/carnivores (e.g., grizzly bear, black bear, wolves), furbearers (e.g., beaver, fisher, marten, wolverine), hoary marmots, bats, birds (forest and alpine birds, raptors, waterfowl), and amphibians (e.g., Columbia spotted frog, western toad).

For the JMM site specifically, the wildlife habitat is high elevation parkland and CMA. Wildlife on the site is limited in its number of resident species due to the relatively exposed conditions that prevail on the Johnny Mountain plateau. Hoary marmots were the most prevalent species observed in the baseline studies in the 1980s (Woznow and Yeager 1999). Marten, weasel, pack rat, deer mouse and northern red-backed voles were other species observed or expected to be present at the JMM site prior to operations. Pre-existing hoary marmot colonies remained intact during operations despite extremely close proximity to heavy vehicular traffic (Woznow and Yeager 1999). Marten inhabited the unused buildings in 1999, probably feeding on small rodents (Woznow and Yeager 1999). In 2018 a marmot den survey was conducted on site and marmots were found to be abundant in the general area (RTEC 2018a).

Large mammals comprising of mountain goat, wolf, grizzly bear and black bear have historically been observed directly or indirectly at the JMM site. These are all considered transient, however, as no sign of residency has been observed. Mountain goats were observed on the side slopes of Johnny Mountain for several days during pre-production observations (Woznow and Yeager 1999). SnipGold prepared and implemented a Goat Management Plan upon acquiring the property in 2016 (SnipGold 2016; RTEC 2016).

Figure 1.2-1  
Project Location

## 1.4 Regional Management Plans

The site is located within the provincial Cassiar-Iskut Land and Resource Management Plan (CIS LRMP), and within the Lower Iskut Resource Management Zone (RMZ). The CIS LRMP, which encompasses approximately 5.2 million ha, was completed in October 2000 with the support of the Tahltan joint councils, representing the Tahltan and Iskut bands (BC ILMB 2000a,b). Land management within the CIS LRMP includes objectives intended to preserve the physical, aesthetic, and cultural characteristics of the region. The CIS LRMP acknowledges and confirms the importance of the economic potential of the area's mineral and energy resources. Under the plan, exploration and development of mineral deposits, as well as construction of access roads, are allowable activities, except within protected areas.

Some of the goals/desired future state for this land use region includes the establishment of a world class mining and energy industry, and economically and environmentally sound mining industry that provides long term benefits to the local community, and certainty of access to support a viable exploration industry. The continued operation of the Bronson airstrip and exploration activities for the Iskut Project are in line with the existing CIS LRMP goals and growth strategies.

## 1.5 Goals and Objectives

The overall land use objective as established in the 1999 closure plan update is to return disturbed lands and new anthropogenic landforms to their original land use and capability of alpine tundra wildlife habitat (Woznow and Yeager 1999).

Five supporting closure objectives that support the overall land use objective are outlined below (as described in the 1999 Closure Plan):

1. Develop a closure scenario that prevents potential impacts to surface and groundwater resources.
2. Restore the natural appearance of the area after mining ceases through the re-contouring and re-vegetation of disturbed lands and anthropogenic landforms.
3. Ensure that disturbances and re-developed landforms are stable from a long-term geotechnical and geochemical perspective.
4. Re-vegetate the site through the development of self-sustaining natural successional processes.
5. Develop landforms and vegetative cover that provide a stable and productive wildlife habitat for resident and transient species utilizing the area.

*Mines Act* Permit M-178 (Permit M-178) stipulates that the average land capability to be achieved should not be less than the average that existed pre-mining, excepting the tailings pond area which is exempt from this requirement.

This report focuses on the reclamation and associated activities conducted under Permit M-178. However, there are related project components and activities that are summarized in this report and reported on in associated JMM compliance reports. For example, work conducted at the Main Landfill is conducted in accordance with the amended *EMA* Permit PR-7927 (Appendix A) and required updates are provided in detail within the 2020 report for Permit PR-7927.

## 1.6 Summary of Historical Reclamation Activities

### 1.6.1 Overview

Prior to the acquisition of the site by SnipGold, mine reclamation activities were being conducted on a campaign basis beginning in 2000 (Yeager 2001). Annual reclamation reports were submitted each year from 1988 to 2001 and from 2008 to 2015. Reclamation work completed prior to the current SnipGold ownership structure (i.e., prior to 2016) included:

- o Removal of mobile equipment.
- o Demolition and disposal of some unused accommodation and ancillary buildings.
- o Reclamation and vegetation of unused mine areas, roads and borrow areas.
- o Re-distribution of tailings with the TSF such that all but a small portion were situated underwater.
- o Construction of TSF spillway

Since acquiring the property, SnipGold has prepared and submitted annual reclamation reports on an annual basis from 2016 to present.

Detailed annual reclamation report histories are included in the 2017 report (RTEC 2018b). A brief history of the reclamation activities carried out between 2016 and 2019 is provided below. Activities completed in 2020 are described in Chapter 3 and Chapter 4 of this report. The current condition (i.e. to December 31, 2020) of disturbed and reclaimed areas is provided in Section 2.5 and summarized in Table 2.5-1 of this report in accordance with the Standard Table 1 (Summary of Areas Disturbed and Reclaimed) specified in the Annual Reclamation Report general information and format requirements from the Ministry of Energy, Mines, and Low Carbon Innovation (EMLI; January 2021).

### 1.6.2 2016

Seabridge Gold Inc. acquired SnipGold Corp. and their associated properties on June 21, 2016. In 2016, SnipGold carried out permit compliance programs as well as a voluntary Aquatic Characterization Program. New reclamation activities were completed in 2016, along with reclamation planning for the next five years. Details of the 2016 activities can be found in the *Iskut Project: Annual Reclamation Report for 2017: Mines Act Permit M-178* (RTEC 2018b).

The following Environmental Protection (Environmental and Engineering) activities took place in 2016:

- o Completion of the compliance surface water quality program, which included *EMA* Permit PE-8415 permit stations including additional locations identified in the 2000 permit amendment;
- o Completion of a voluntary comprehensive 2016 Johnny Mountain Mine Aquatic Characterization Program, which included water quality, sediment quality, benthic invertebrates, and fisheries sampling and included a regional geographical area;
- o Installation of two hydrology stations to monitor water quantity exiting the TSF via the spillway and TSF seepage;
- o Inspection of existing groundwater wells around the TSF;
- o Installation of a meteorological station ~400 m west of the TSF;
- o A dam safety review (DSR) of the TSF was conducted in August 2016. The Engineer of Record was transferred to Neil K. Hemrajani Singh, P.Eng of Klohn Crippen Berger;

- Conducted an Archeological Impact Assessment in exploration area; and
- Developed of an Iskut Project Goat Management Plan.

The following Reclamation Program activities took place in 2016:

- A dam safety review (DSR) conducted in August 2016. The Engineer of Record was transferred to Neil K. Hemrajani Singh, P.Eng of Klohn Crippen Berger (KCB); and
- The development of a five-year Johnny Mountain Mine Project Execution Plan that met the objectives of the approved Closure and Reclamation Plan.

### 1.6.3 2017

In 2017, SnipGold carried out permit compliance programs as well as voluntary environmental programs. New reclamation activities were completed in 2017, along with reclamation planning for the next five years. Details of the 2017 activities can be found in the *Iskut Project: Annual Reclamation Report for 2017: Mines Act Permit M-178* (RTEC 2018b).

The following Environmental Protection (Environmental and Engineering) activities took place in 2017:

- Completion of the compliance surface water quality monitoring program, which included *EMA* Permit PE-8415 permit station locations;
- Completion of a voluntary comprehensive 2017 Johnny Mountain Mine Aquatic Characterization Program, which included water quality, sediment quality, and hydrology (as a continuation of the 2016 Aquatic Characterization Program);
- Conducted a bathymetric survey of the TSF;
- Collected tailings samples from within the TSF for geochemical characterization;
- Installation of two hydrology stations to monitor TSF seepage;
- Installation of hydrology stations to monitor water discharging from the portals;
- Inspection of existing groundwater wells around the TSF;
- Installation of new groundwater wells and advancement of test pits around the local site area;
- Installation of new vibrating wire level loggers in groundwater wells around the Tailings Storage Facility (TSF);
- Operated a meteorological station ~400 m west of the TSF;
- Completion of archeological overview assessments of the Quartz Rise Exploration Track;
- Removed and replaced the Sky Creek Bridge which is located along the access road; and
- Constructed the Quartz Rise Exploration Track.

The following Reclamation Program activities took place in 2017:

#### Tailings Storage Facility (TSF)

- A Dam Safety Inspection (DSI) of the TSF was conducted by Neil K. Hemrajani Singh, P.Eng of KCB on August 23, 2017;
- Completion of an updated dam classification and breach analysis study;

- Completion of a TSF Closure Design Report;
- General maintenance of the TSF including additional fill placement and grading of the TSF;
- Removal of crane and SeaCan from the TSF berm;
- General cleanup around the TSF including removal of wood and vegetation from the spillway; and
- Construction of test pad within the TSF to give an indication of the stability of the existing tailings when placing additional future fill.

#### Mill Building

- Assessed the structural integrity of the Mill Building;
- Installation of groundwater monitoring wells around the Mill Building to collect geotechnical information;
- Site grading and ditching around the Mill Building;
- Removal and off-site shipment of hazardous waste from the Mill Building;
- Avalanche sensitivity assessment of Mill Building and TSF-site visit by BGC Engineering;
- Installation of cross-bracing on Mill Building; and
- Removal of mercury vapor bulbs from inside of Mill Building.

#### Fuel Tanks

- Certification of fuel tanks;
- Demolition of Old Tank Farm and general area cleanup;
- Cut up cleaned metal and stockpiled for future removal from site;
- Clean up of 300 L diesel spill; and
- In-situ remediation of hydrocarbon contaminated soils.

#### Other Johnny Mountain Site Activities

- Test pitting for Main Landfill expansion;
- Sourcing TSF cover material and sampling;
- Decommissioning of Johnny Mountain Mine airstrip;
- Closure plan of portals and vents-site visit by Golder Associates;
- Temporary closure of portal 11 and 12 by earth type barricade;
- Temporary closure of vent raise to portal 11 using beams and plywood to cover surface opening;
- Maintenance activities including cover materials added to the Main Landfill;
- Grass seeding of 2017 disturbed areas on Johnny Mountain site due to groundwater well drilling operations; and
- Upgrades to access road from Bronson airstrip to Johnny Mountain site.

#### 1.6.4 2018

In 2018, SnipGold carried out permit compliance programs. New reclamation activities were also completed in 2018, along with reclamation planning for the next five years. Details of the 2018 activities can be found in the *Iskut Project: Annual Reclamation Report for 2018: Mines Act Permit M-178* (RTEC 2019a).

The following Environmental Protection (Environmental and Engineering) activities took place in 2018:

- Completion of the compliance surface water quality monitoring program for *EMA* Permit PE-8415;
- Completion of the compliance groundwater and surface water quality monitoring program for *BC EMA* Permit PR-7927 which was amended on April 17, 2019;
- Operation and maintenance of the Johnny Mountain meteorological station located ~400 m west of the TSF;
- Installation and operation of two hydrology stations to monitor TSF seepage;
- Monitoring groundwater flow from the level 10, level 11, and level 12 portals;
- Groundwater well level and water quality sampling; and
- Marmot den survey in area of upgraded Main Landfill and borrow areas.

The following Reclamation Program activities took place in 2018:

- Landfill Upgrades - Cells 1 and 2 of the Main Landfill were constructed, filled, and covered with a temporary landfill cover, and runoff was directed to the TSF.
- Relocation of material to the upgraded Main Landfill including Disposal Site #1 and #2 material, old septic tanks, and material from general site cleanup.
- Ore concentrate was removed from the Mill Building and placed below water cover in the tailings storage facility.
- Five vent raises were permanently closed, and the ground surface was re-contoured and seeded.
- The Portal 10 was demolished and the area re-contoured and seeded.
- Demolition waste from Portal 12 (generated in 2017) was relocated to the upgraded Main Landfill.
- In-situ hydrocarbon remediation was carried out near the Old Tank Farm area (now In-situ Hydrocarbon Remediation Area).
- A dam safety inspection was conducted by Klohn Crippen Berger David Willms, P.Eng. (KCB), under the direction of Engineer of Record Neil K. Hemrajani Singh, P.Eng (KCB), on August 20-22, 2018.
- Other opportunistic reclamation activities including:
  - Repairs to onsite equipment;
  - Additional test pits;
  - Septic Tank and Riser removal;
  - Demolition of Old Exploration Cabin;
  - Waste Disposal Site #3 relocation to the approved landfill, cleanup, re-contoured;
  - Grading around piezometers located on the TSF;

- Drainage Improvements around Old Tank Farm and Mill Building;
- Island removal within TSF;
- General Site cleanup; and
- Re-vegetation of disturbed areas.

### 1.6.5 2019

In 2019, SnipGold carried out permit compliance programs and completed new reclamation activities, along with reclamation planning for the next five years. Details of the 2019 activities can be found in the *Iskut Project: Annual Reclamation Report for 2019: Mines Act Permit M-178 (RTEC 2020b)*.

The following Environmental Protection (Environmental and Engineering) activities took place in 2019:

- o Completion of the compliance surface water quality monitoring program for *EMA* Permit PE-8415 which was amended on June 10, 2019;
- o Completion of the compliance groundwater and surface water quality monitoring program for *BC EMA* Permit PR-7927 which was amended on April 17, 2019;
- o Operation and maintenance of the Johnny Mountain Mine meteorological station located ~400 m west of the TSF;
- o Installation and operation of two hydrology stations to monitor TSF seepage;
- o Monitoring groundwater flow from the level 10, level 11, and level 12 portals;
- o Monitoring groundwater levels and water quality sampling; and
- o Initiation of vegetation trials on the decommissioned airstrip.

The following Reclamation Program activities took place in 2019:

- o Main Landfill activities. Non potentially acid generating (NPAG) gravel was hauled from Borrow Areas #1 and #3 to the Cell 2 area, placed and compacted for the base levelling course. A total of 3,352 m<sup>3</sup> of inert waste was placed at the approved Main Landfill, and covered with a minimum of 300 mm of mineral soil.
- o Relocation of material to the upgraded Main Landfill included non-hazardous material from the former warehouse site, portal 11 mechanics shop, the Old Tank Farm, and from the Mill Building.
- o Excavation and relocation of five **additional un-documented waste sites to the Main Landfill.**
- o Mill building reclamation continued with further deconstruction of much of the remaining (interior) mine equipment, cyanide tanks, conveyors, pumps, wood timbers and non-load bearing steel structural members.
- o In-situ hydrocarbon remediation continued in the In-situ Hydrocarbon Remediation Area. Approximately 6,000 m<sup>3</sup> of contaminated soils were treated.
- o A trial placement of PAG material excavated from the decommissioned airstrip was mixed with hydrated lime and was placed in two areas in the TSF to assess closure cover constructability. A total of 2,620 m<sup>3</sup> of waste rock mixed with 635 kg of hydrated lime was placed in the TSF in 2019.
- o A dam safety inspection was conducted on August 13 to 14, 2019 by Engineer of Record Neil K. Hemrajani Singh, P.Eng. of KCB and Drew Hegadoren, P.Eng. of KCB, with SnipGold representatives Kevin Hidber and Brent Murphy, as well as Elizabeth Miller (TSF Qualified Person) in attendance.

- Other reclamation activities including:
  - Repairs to onsite equipment;
  - Portal 11 Site Grading;
  - Excavation of ground water diversion trench east of Old Tank Farm;
  - Additional test pits;
  - Onsite testing for ML/ARD of waste rock at portal 10, 11 and 12 and decommissioned airstrip;
  - Repairs to piezometers located on the TSF (DH17-02 and DH17-05);
  - Lower remaining two ore islands inside the TSF below water elevation;
  - Rough and loose technique used on north section of decommissioned airstrip ~ 0.8 ha;
  - Copper Wire salvage and recycling; and
  - Burning of un-treated timbers.

### 1.7 Progressive and Ongoing Reclamation

SnipGold's focus at the JMM Site is reclamation and closure of the site. SnipGold have developed a JMM Project Execution Plan that guides the sequencing of these reclamation activities annually.

Due to the COVID-19 pandemic in 2020 and the associated health and safety risks, activities outlined in the 2020 Project Execution Plan for the non-operating Johnny Mountain Mine site were deferred. On site activities in 2020 were limited to compliance related requirements associated with SnipGold's *Mines Act* Permit M-178, EMA Permit PR-7927 and EMA Permit PE-8415.

The 2021 Project Execution Plan can be found in Appendix C.

SnipGold also has an active exploration program ongoing in the general area; the exploration activities and associated reclamation activities are authorized under *Mines Act* Permit MX-1-46.

## 2. HISTORICAL MINING PROGRAM

### 2.1 Surface Development to Date

The remaining surface development on site is described in Section 2.5 below (including Standard Table 1 from the EMLI ARR requirements (January 2021)). Reclamation efforts continue to remove remaining surface infrastructure and reclaim areas where historical infrastructure was located.

In order to provide a safe and appropriate disposal location for non-hazardous waste on site, two cells of the Main Landfill were upgraded in 2018. These two cells of the Main Landfill continued to be available for use, however no waste was deposited in 2020. Due to the COVID-19 provincial health restrictions, no mine reclamation works or landfill upgrades took place during 2020. However, Permit PR-7927 requires an annual inspection of erosion prevention and sediment control measures. On 29 August, 2020, the Main Landfill inspection (refer to Appendix D) was conducted in parallel with the 2020 Site Environmental Investigation.

### 2.2 Current Life of Mine

The Johnny Mountain Mine has been closed since 1993. While SnipGold has an active annual exploration season, there are currently no plans to reopen the former mine.

### 2.3 Surface Development in the Past Year

No new surface infrastructure developments occurred in 2020. Details of the locations and surface areas are provided in Section 2.5 below.

### 2.4 Surface Development Projected over the Next Five Years

SnipGold is focused on reclaiming and closing the site as outlined in the Closure Plan. Phase 2 development of the Main Landfill upgrade is planned prior to the demolition of the mill building. Temporary borrow areas will continue to be used for reclamation and closure activities (i.e., TSF closure and Main Landfill). No surface infrastructure development is projected from 2021 to 2024.

### 2.5 Disturbed Areas (Location, Aspect, and Size in Hectares)

Table 2.5-1 presents the required summary of the areas disturbed and reclaimed to end 2020 (Standard Table 1 in the EMLI ARR requirements (January 2021)), which specifies the following: *Ensure that the exempt area reported is not double-counted under the different classifications. In the body of the report, the exempt areas must be specified, rational provided for the exemption, and maps included depicting the exempt areas.*

For the Johnny Mountain site, the TSF (i.e., tailings pond area) is excluded as specified in Section 3 of Permit M-178: “**excluding the tailings pond area, the average land capability to be achieved in the remaining lands shall not be less than the average that existed prior to mining**”. Based on this condition in Permit M-178, the TSF is not required to achieve average pre-disturbance land capability. The TSF is 9.02 ha, and the embankment is 3.23 ha, for a total area of 12.25 ha that is excluded from the land capability permit requirement. As of the end of 2020, the area left to be re-contoured and seeded/planted at JMM Site is 28.31 ha (excluding the TSF area).

Table 2.5-1: Summary of Areas Disturbed and Reclaimed to December 31, 2020 (Standard Table 1)

Disturbance	Mining		Reclamation								Land Use Objective
	Area Disturbed (ha)		Area Contoured (ha)		Area Seeded/Planted (ha)		Area Fertilized (ha)		Area Re-vegetated (ha)		
	2020	Total	2020	Total	2020	Total	2020	Total	2020	Total	
Tailings Storage Facility	0	12.25	exempt								exempt
Waste Rock Storage Areas (Level 10, 11, 12 portal pads)	0	1.11	0	0	0	0	0	0	0	0	alpine tundra wildlife habitat
Decommissioned Airstrip <sup>a</sup>	0	5.26	0	0	0	0	0	0	0	0	alpine tundra wildlife habitat
Five Vent Raises	0	0	0	1.25	0	1.25	0	0	0	0	alpine tundra wildlife habitat
Three Portals (Level 10, 11, 12), not including areas of pads containing waste rock	0	0.16	0	0.88	0	0.88	0	0	0	0	alpine tundra wildlife habitat
Mill Building	0	0.82	0	0	0	0	0	0	0	0	alpine tundra wildlife habitat
Septic Field Area	0	0	0	0.56	0	0.56	0	0	0	0	alpine tundra wildlife habitat
General Laydown Area south of airstrip	0	1.99	0	0	0	0	0	0	0	0	alpine tundra wildlife habitat
Main Landfill Area (includes cells 1 and 2 and Borrow Area #3)	0	2.64	0	0	0	0	0	0	0	0	alpine tundra wildlife habitat
Local Site Roads	0	4.71	0	0	0	0	0	0	0	0	alpine tundra wildlife habitat
Access Road from Bronson Airstrip to JMM	0	2.82	0	0	0	0	0	0	0	0	alpine tundra wildlife habitat
Core Storage Area	0	0.11	0	0	0	0	0	0	0	0	alpine tundra wildlife habitat

Disturbance	Mining		Reclamation								Land Use Objective
	Area Disturbed (ha)		Area Contoured (ha)		Area Seeded/Planted (ha)		Area Fertilized (ha)		Area Re-vegetated (ha)		
	2020	Total	2020	Total	2020	Total	2020	Total	2020	Total	
Disposal Sites #1, #2 and #3 (waste relocated to Main Landfill in 2018)	0	0.1	0	1.95	0	1.95	0	0	0	0	alpine tundra wildlife habitat
Borrow Area #1 (New: Required for future TSF closure activities)	0	5.42 <sup>b</sup>	0	0	0	0	0	0	0	0	alpine tundra wildlife habitat
Old Exploration Cabin	0	0	0	0.3	0	0.3	0	0	0	0	alpine tundra wildlife habitat
In-situ Hydrocarbon Remediation Area <sup>c</sup>	0	1.04	0	0	0	0	0	0	0	0	alpine tundra wildlife habitat
General Mine Site <sup>d</sup>	0	2.13	0	4.03	0	0	0	0	0	0	alpine tundra wildlife habitat
Total	0	40.56		8.97		4.94					

<sup>a</sup> 0.8 ha of the Decommissioned Airstrip is being utilized as part of a revegetation trial. This has not been registered in the contoured and seeded/planted columns. See Section 4.1.4 for details of the trial.

<sup>b</sup> The total disturbance area comprises existing disturbance and projected future disturbance required for planned reclamation activities.

<sup>c</sup> 'In-situ Hydrocarbon Remediation Area' has replaced the Old Tank Farm area. Old Tank Farm structures were removed in 2017 from the area and on site hydrocarbon contaminated soil remediation treatment has been conducted in the area since 2018. The area used for in-situ hydrocarbon remediation extends beyond the original 0.39 ha of the Old Tank Farm. Related disturbance areas have been adjusted accordingly.

<sup>d</sup> 'General Mine Site' includes areas of JMM Site that are not directly associated with existing on-site infrastructure or on-going activities.

No activities were completed at the JMM site in 2020 that resulted in changes to the areas disturbed and reclaimed. Previously, in 2019 (as in 2018), the areas disturbed and reclaimed were updated based on measurements made by site personnel. The areas of disturbed, reclaimed, or seeded/re-vegetated areas were measured and recorded by SnipGold, and are presented and summarized in Table 2.5-1 and Figure 2.5-1.

Most of the buildings and infrastructure at the site have been emptied, demolished, and burned. The following structures remain at the site:

- o the Mill Building; and
- o a shipping container.

Mobile equipment remaining at the site includes: CAT D8L Dozer, Kenworth DumpTruck, CAT 235 Excavator, CAT 312 Excavator, and CAT D8K Dozer.

## 2.6 Disposal/Storage Locations and Volumes of Tailings and Waste Rock

The information on disposal/storage locations and volumes of tailings, waste rock and overburden is provided in Table 2.6-1 (per EMLI (January 2021) Standard Table 2 Quantities of Waste Rock, Tailings, Low Grade Ore, Coarse Reject, and Other Mine Waste). Volumes and ML/ARD classification of waste rock and tailings for the Johnny Mountain Mine site are also summarized in Table 2.6-1.

No changes to the total quantities presented in Table 2.6-1 are reported for 2020, compared to 2019.

## 2.7 Mining and Milling Production

The JMM has not been operational since 1993, hence no Table 3 (Monthly Milling and Milling Production) is provided.

## 2.8 Custom Milling Production

The JMM has not been operational since 1993, hence no Table 4 (Monthly Custom Milling Production) is provided.

## 2.9 Stockpiling of Surface Soil Materials

There is no stockpile of surface soil materials for reclamation use available on the JMM site, so no Table 5 (Quantities of Soil and Overburden Salvaged and Stockpiled for Reclamation Use) is provided.

Figure 2.5-1  
Site Layout

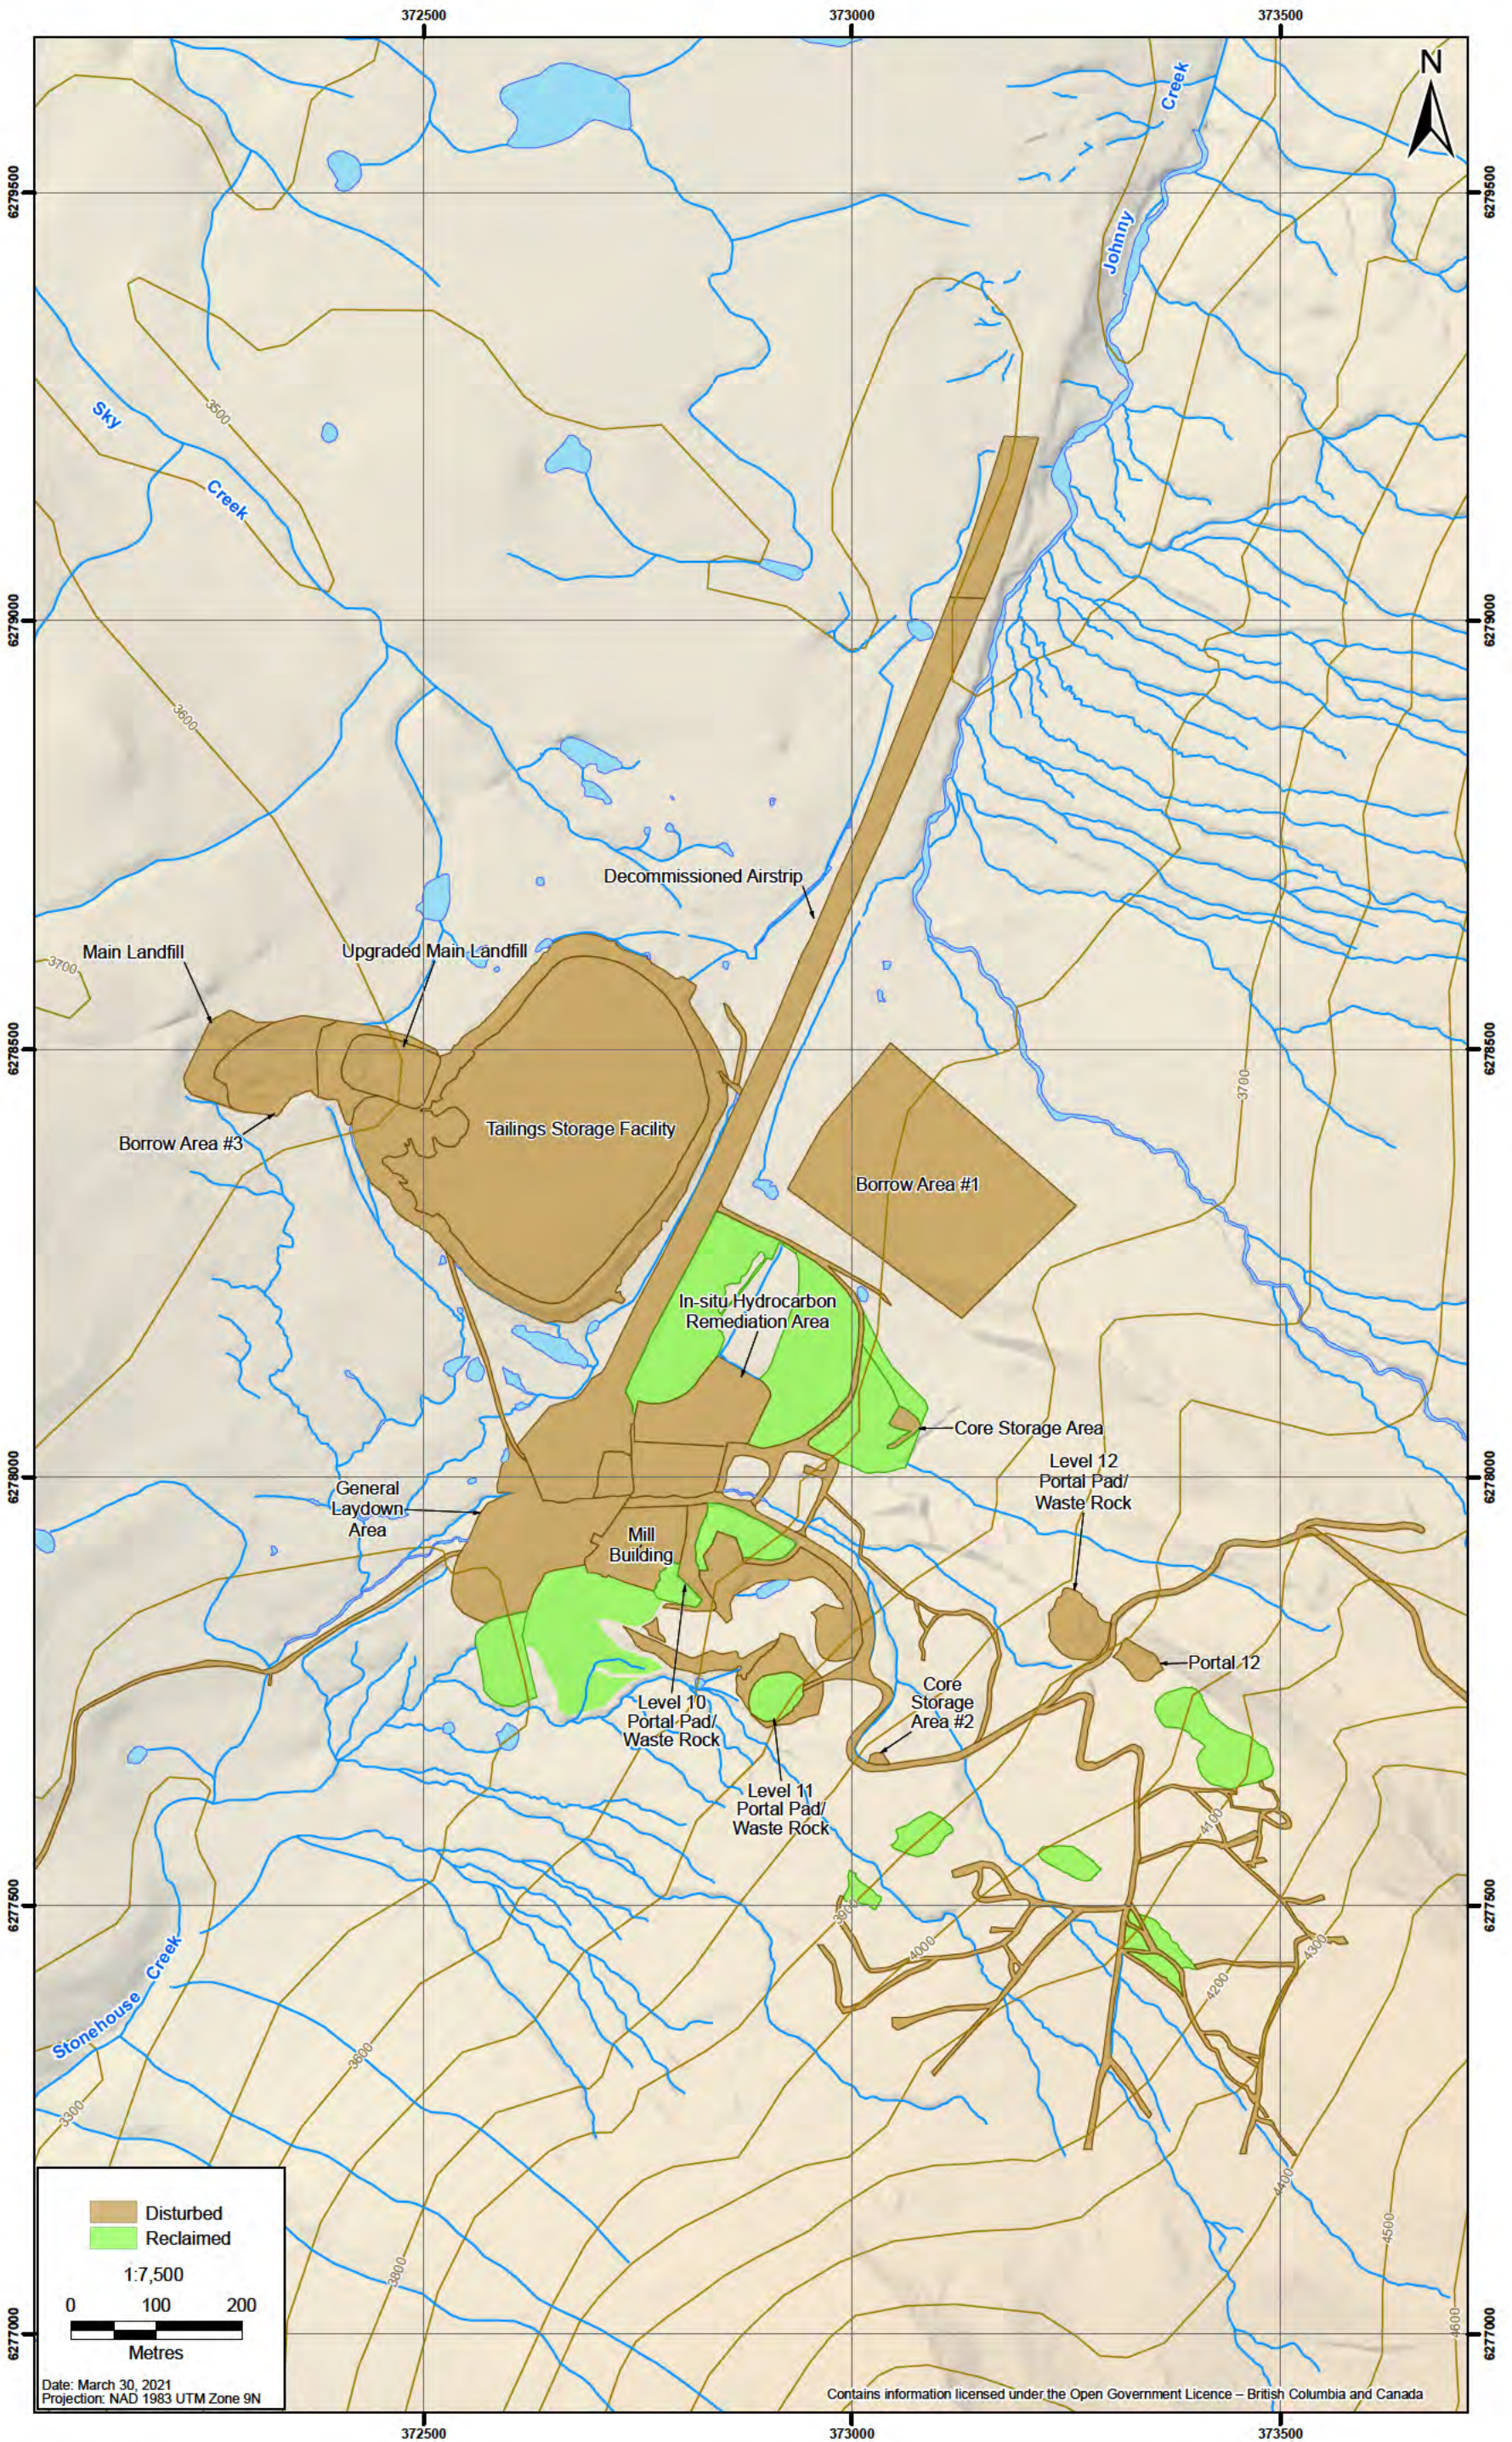

Table 2.6-1: Quantities Of Waste Rock, Tailings, Low Grade Ore, Coarse Reject and Other Mine Waste as of December 31, 2020 (EMLI Standard Table 2)

Name of Waste Pile or Pond	Acid Generating Waste		Potentially Acid Generating Waste**			Non-Acid Generating Waste**	
	2020	Total	2019 Total	Amount Relocated to the TSF in 2020	Updated Amount as of End of 2020	2020	Total
<b>Waste Dumps*</b>							
1. Portal 10 Pad	0	0	74,943 t	0	74,943 t	0	0
2. Portal 11 Pad	0	0	53,000 t	0	53,000 t	0	0
3. Portal 12 Pad	0	0	25,000 t	0	25,000 t	0	0
4. Decommissioned airstrip	0	0	4,314 t	0	4,314 t	0	0
5. Secondary access road	0	0	10,000 t	0	10,000 t	0	0
<i>Total</i>	0	0	167,257 t	0	167,257 t	0	0
<b>TSF</b>							
1. Johnny Mountain	0	0	207,743 t	0	207,743 t	0	0
<i>Total</i>	0	0	207,743 t	0	207,743 t	0	0
<b>Low Grade Ore / Coarse Reject / Other Mine Waste</b>							
1. None	0	0	Unknown ***	0	Unknown	0	0
<i>Total</i>	0	0	Unknown	0	Unknown	0	0

\* There are no designated waste dumps at the site; the portal pad areas contain waste rock. Original waste rock tonnages are from Price and Yeager 2004.

\*\* 2017 testing indicates that some material in each portal pad is NPAG (Non potentially acid generating); however, the material cannot be segregated.

\*\*\* 45 m<sup>3</sup> of ore concentrate was removed from the Mill Building in 2018 and relocated to the TSF.

### 3. ENVIRONMENTAL AND ENGINEERING ACTIVITIES

The most recent version of the *Mines Act* Permit *General Information and Format Requirements for Annual Reclamation Reports* (EMLI; updated January 2021) was used for the preparation of this chapter. The guidelines list many potential components for an Environmental Protection Program described here as the Environmental and Engineering Activities. The following sections provide information on the requested components from the guidelines for the past year, including projections for next year.

#### 3.1 Past Year: 2020 Activities

##### 3.1.1 *Environmental Management Systems/Plans/Audit*

SnipGold's focus for the site's Environmental Management Systems include complying with the existing permits, and conducting its exploration and reclamation programs in a safe and cost effective manner.

In 2020, SnipGold prepared an updated Closure Plan and an updated Closure Management Manual for JMM; these were submitted to EMPR March 31, 2020 for review and approval.

Additional management plans in place and implemented for activities carried out at JMM include:

- JMM Reclamation Project Execution Plan;
- Health, Safety and Environmental Plan;
- Erosion Prevention and Sediment Control Plan for the Main Landfill Upgrades;
- Drainage Management Plan; and
- Iskut Goat Management Plan.

Due to the COVID-19 health restrictions, no mine reclamation works or landfill upgrades took place during 2020. However, Permit PR-7927 requires an annual inspection of erosion prevention and sediment control measures. On 29 August, 2020, the Main Landfill inspection was conducted in parallel with the 2020 Site Environmental Investigation carried out by Wood (refer to Section 3.1.7).

SnipGold retains overall responsibility for implementation and maintenance of the erosion prevention and sediment control (EPSC) measures while Wood provides training, ongoing support, inspections, and assessment of the effectiveness of the controls. As outlined in Section 3.1.7, minor erosion was noted during the 2020 site inspection, however, the EPSC measures were observed to be effective. Wood concluded that the Erosion Prevention and Sediment Control measures complied with the plans and supporting documents, such as the Wood design guidelines and Ministry of Environment and Climate Change Strategy (ENV) Permit PR-7927 requirements (Appendix D).

In 2020, a Drainage Management Plan was prepared by RTEC (RTEC 2021b) to address Conditions 3, 4(b), and 5 of Permit M-178. The Drainage Management Plan is described in Section 3.1.6.

##### 3.1.2 *ML/ARD Characterization and Mine Waste Management*

After the acquisition of SnipGold by Seabridge, additional geochemical characterization studies of tailings, waste rock, the decommissioned airstrip, and Portal 10 cribbing waste material were completed to inform reclamation activities and were reported in the 2017 and 2018 Annual Reclamation Reports (RTEC 2018b, 2019). Waste ore concentrate was relocated to the TSF in 2018 (RTEC 2019a).

In consideration of the requirements of Permit M-178, in 2019, SnipGold continued planning for the relocation of PAG waste rock to the TSF from the portal pads and isolated pockets from the decommissioned airstrip and secondary roads. PAG material from two locations at the decommissioned airstrip and from the Portal 10 pad was relocated to the TSF. A total of 2,620 m<sup>3</sup> of waste rock was disposed in the TSF in 2019.

Additional testing was conducted in 2019 to refine the process of relocating this material, and to determine potential treatment requirements for the material. SnipGold commissioned BOE Water to conduct the test work and trials for treating and relocating waste rock to the TSF (BOE 2020). BOE recommended that waste rock be amended with lime before it is deposited into the TSF to add neutralization potential and prevent the release of dissolved metals. Lime addition with PAG waste rock deposited in the TSF is a requirement of the ML/ARD section of the Permit M-178, subsection 2 c: Disposal of PAG Waste Material:

*The Permittee shall monitor the rinse pH of all PAG waste rock being placed in the tailings impoundment. Where the rinse pH is less than 4.5, the Permittee shall add alkalinity at a rate of 75 g/tonnes of waste rock (i.e. 2kg of lime per 25 tonnes of waste rock during excavation and loading of the trucks. No lime is to be applied when the daily pH in the tailings impoundment exceeds 7.5.*

In 2020, to limit exposure from outbreak of the COVID-19 virus, heavy equipment was not available at the Site and Site activities during the 2020 season were limited to permit compliance and environmental monitoring. No material/waste rock was moved to the TSF.

Table 2.6-1 presents the quantities of waste rock and tailings at the Johnny Mountain Mine site in accordance with Standard Table 2 in the guidelines.

### 3.1.3 Surface Water Quality and Quantity Monitoring

#### 3.1.3.1 Surface Water Quality Monitoring

Surface water quality monitoring in 2020 was carried out in accordance with permits PE-8415 and PR-7927 (Appendices F and G).

#### Permit PE-8415 Surface Water Quality Monitoring

Conditions of Permit PE-8415 require annual surface water quality sampling at seven stations within the JMM local area (JM1 to JM7), and one field duplicate sample and one travel blank. Authorized discharge characteristics are provided in Table 3.1-1. The only numeric discharge limits (0.05 mg/L dissolved copper, and 0.2 mg/L dissolved zinc) are for Station JM5, which is located downstream of the TSF spillway prior to entering Johnny Creek. For the remaining stations, the authorized discharge characteristics are qualitative. There are no specified limits for discharge rates or volumes at any of the stations. Table 1 of Permit PE-8415 designates the required parameter list: pH, hardness, sulphate, dissolved copper, dissolved iron, and dissolved zinc.

Water quality samples were collected on August 23 and 24, 2020. Table 3.1-1 provides a summary of the locations of sampling stations, and Figure 3.1-1 illustrates the sampling locations. The 2020 annual report for Permit PE-8415 is included as Appendix E. No non-compliance events occurred in 2020.

Figure 3.1-1  
Permit PE-8415 Water Quality Sampling Stations

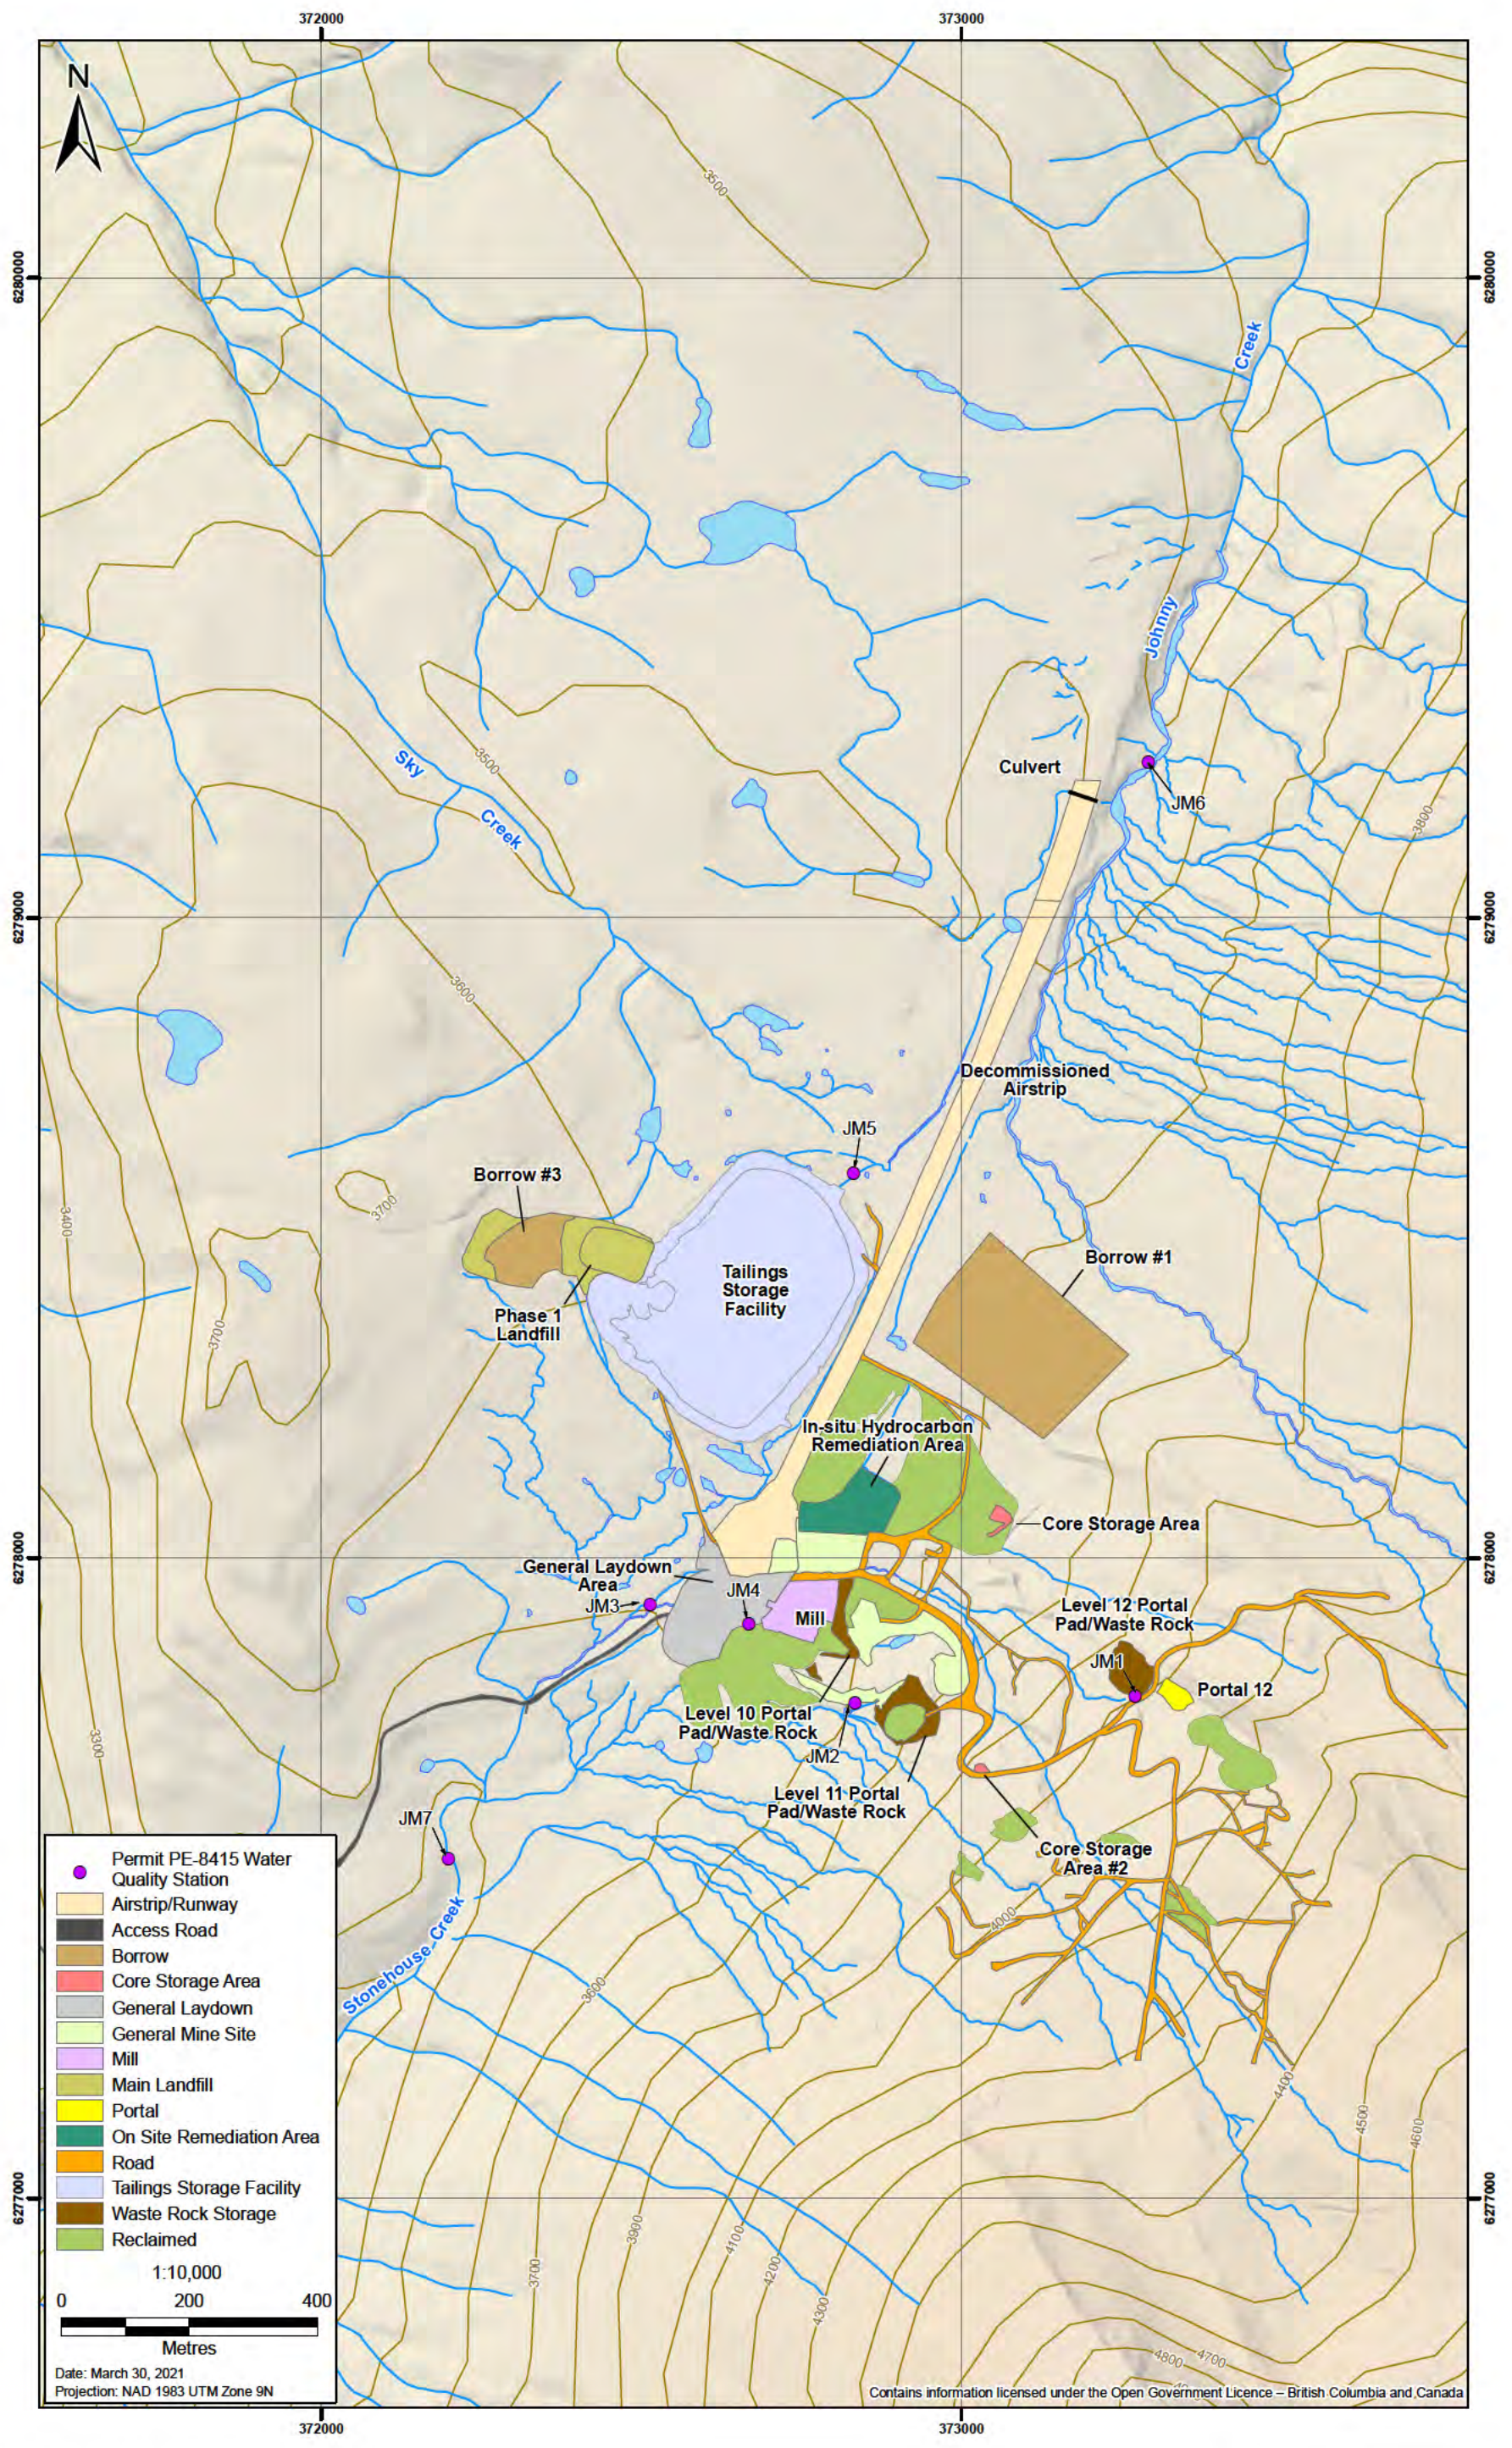

Table 3.1-1: Surface Water Quality Station Descriptions and Conditions Outlined in Permit PE-8415

Station	Description (from amended permit)	Authorized Discharge Limits or Characteristics of Discharge
JM1	12-Level Waste Rock Seepage	The characteristics of the discharge must be typical of leachate, which has passed through inert waste rock
JM2	11-Level Waste Rock Seepage	The characteristics of the discharge must be typical of leachate, which has passed through inert waste rock
JM3	10-Level Waste Rock Seepage	The characteristics of the discharge must be typical of leachate, which has passed through inert waste rock
JM4	Mine Water Discharge at 10-level portal (represents minewater from all levels)	The characteristics of the discharge must be typical of groundwater seepages coming from #10 level portal
JM5	TSF discharge	0.05 mg/L dissolved copper maximum 0.2 mg/L dissolved zinc maximum
JM6	Johnny Creek at end of Johnny Flats	none
JM7	Stonehouse Creek	none
JM8	Duplicate sample from any one of the sampling stations	none
JM9	Travel blank	none

#### Permit PR-7927 Surface Water Quality Monitoring

Permit PR-7927 includes conditions for groundwater and surface water monitoring down-gradient of the Main Landfill. Monitoring is required for a period of five years commencing in 2018. Hence 2020 reflects the third year of monitoring.

Compliance surface water quality samples were collected on August 23 and 28, 2020. Table 3.1-2 summarizes the required surface water sampling program outlined in EMA Permit PR-7927. Figure 3.1-2 presents the groundwater and surface water sampling stations required under Permit PR-7927. The 2020 annual report for Permit PR-7927 is included as Appendix F.

Table 3.1-2: Surface Water Monitoring Requirements under Permit PR-7927

Monitoring Site	Location Description	Coordinates	Water Quality Sampling
JM10-2018 <sup>1</sup>	Surface water station on a tributary to Sky Creek, downslope from the Main Landfill and upstream from MW17-22.	372498, 6278574	Annually <sup>2</sup> (during summer)

<sup>1</sup> Sky Creek 1.0 is a new site identified in the most recent amendment (April 2019) of Permit PR-7929; however, the label JM10-2018 has been retained by SnipGold for consistency with previous years' monitoring.

<sup>2</sup> Field Parameters: specific conductivity, temperature and pH.

Analytical parameters: Ethylbenzene and Xylenes (BTEX), Extractable Petroleum Hydrocarbon (EPH), Polycyclic aromatic hydrocarbons (PAHs), total metals, pH, alkalinity, bicarbonate, carbonate, chloride, electrical conductivity (EC), fluoride, hardness, nitrate, nitrite, ammonia, sulphate, total dissolved solids (TDS), total inorganic carbon (TIC), total organic carbon (TOC), chemical oxygen demand (COD) and turbidity, acidity (hot peroxide titration) and cyanides (weak acid dissociable (WAD), free, total, cyanate and thiocyanate).

#### 3.1.3.2 Surface Water Quantity

Flow monitoring is required as per ML/ARD condition 4(b) of Permit M-178. Surface water quantity has been monitored on site since 2016.

The objective of the 2020 program was to continue monitoring the water discharging/seeping from the Johnny Mountain Mine TSF (two locations) and three portal discharge locations (level 10, level 11, and level 12 portals). Both automated and manual monitoring methods were used. Automated hydrometric monitoring stations were installed at the two TSF locations and at the level 10 portal. The level 11 and level 12 portal locations are not amenable to installing hydrometric stations due to minimal discharge volumes, and discharge at these locations was measured using manual measurements (RTEC 2021c).

The first 2020 site visit was conducted in mid-June. This site visit included re-installation of two hydrometric stations: one station for the TSF discharge/seepage location (JTS-H1), and one station for the level 10 portal location (P10-A). Due to the depth of snow present at the time of the June site visit and inclement weather hindering safe access to the plateau, hydrometric station JTN-H1 could not be re-installed at that time and was re-installed in July. There were five site visits in total in 2020.

Figure 3.1-3 shows the locations of the monitoring stations and Table 3.1-3 provides station details. Details of the field methods, data analyses, and Quality Assurance/Quality Control (QA/QC) procedures can be found in Appendix G of this report (RTEC 2021c).

Table 3.1-3: 2020 Tailings Storage Facility and Portal Hydrometric Monitoring Stations

Station	Location	Easting	Northing	Period of Operation
JTS-H1	Downstream of seepage. Small stream ~100 m southwest of the tailing pond. Discharges into Stonehouse Creek.	372,609	6,278,081	Jun 14 - Oct 17 (2020)
JTN-H1	Downstream of passive spillway. Small stream ~230 m northeast of the TSF. Discharges into Johnny Creek.	372,973	6,278,720	Jul 9 - Sep 24 (2020)
P10-A	Portal 10 discharge around the northeast side of the old Mill Building. Relocated in 2019 due to reclamation work to ~40 m downstream of portal discharge culvert.	372,802	6,277,921	Jun 14 - Oct 17 (2020)
P11 <sup>a</sup>	Portal 11 discharge upslope of the old Mill Building.	372,955	6,277,725	Aug 31, Sep 25, Oct 17 (2020)
P12 <sup>a</sup>	Portal 12 discharge upslope of the old Mill Building.	373,324	6,277,787	Jul 14, Aug 31, Sep 24, Oct 17 (2020)

Note:

UTM NAD 83, Zone 9V

<sup>a</sup> Manual discharge measurements only

The relationships between stage and discharge were established for the three monitoring stations with available data (JTS-H1, JTN-H1 and P10-A). The 2020 stage-discharge measurements were compared to the existing rating curves to determine if the relationships were still valid. Where geomorphic changes to the channel occurred and rating points did not plot along the existing rating curve, a new curve was developed. Between six and thirteen rating points from the 2016 through 2020 monitoring programs were used to develop each curve. The rating equations are summarized in Table 3.1-4 and 2020 rating curves along with previous 2016 through 2019 curves are presented in Appendix G (RTEC 2021c).

Figure 3.1-2  
Permit PR-7927 Groundwater and Surface Water Sampling Stations

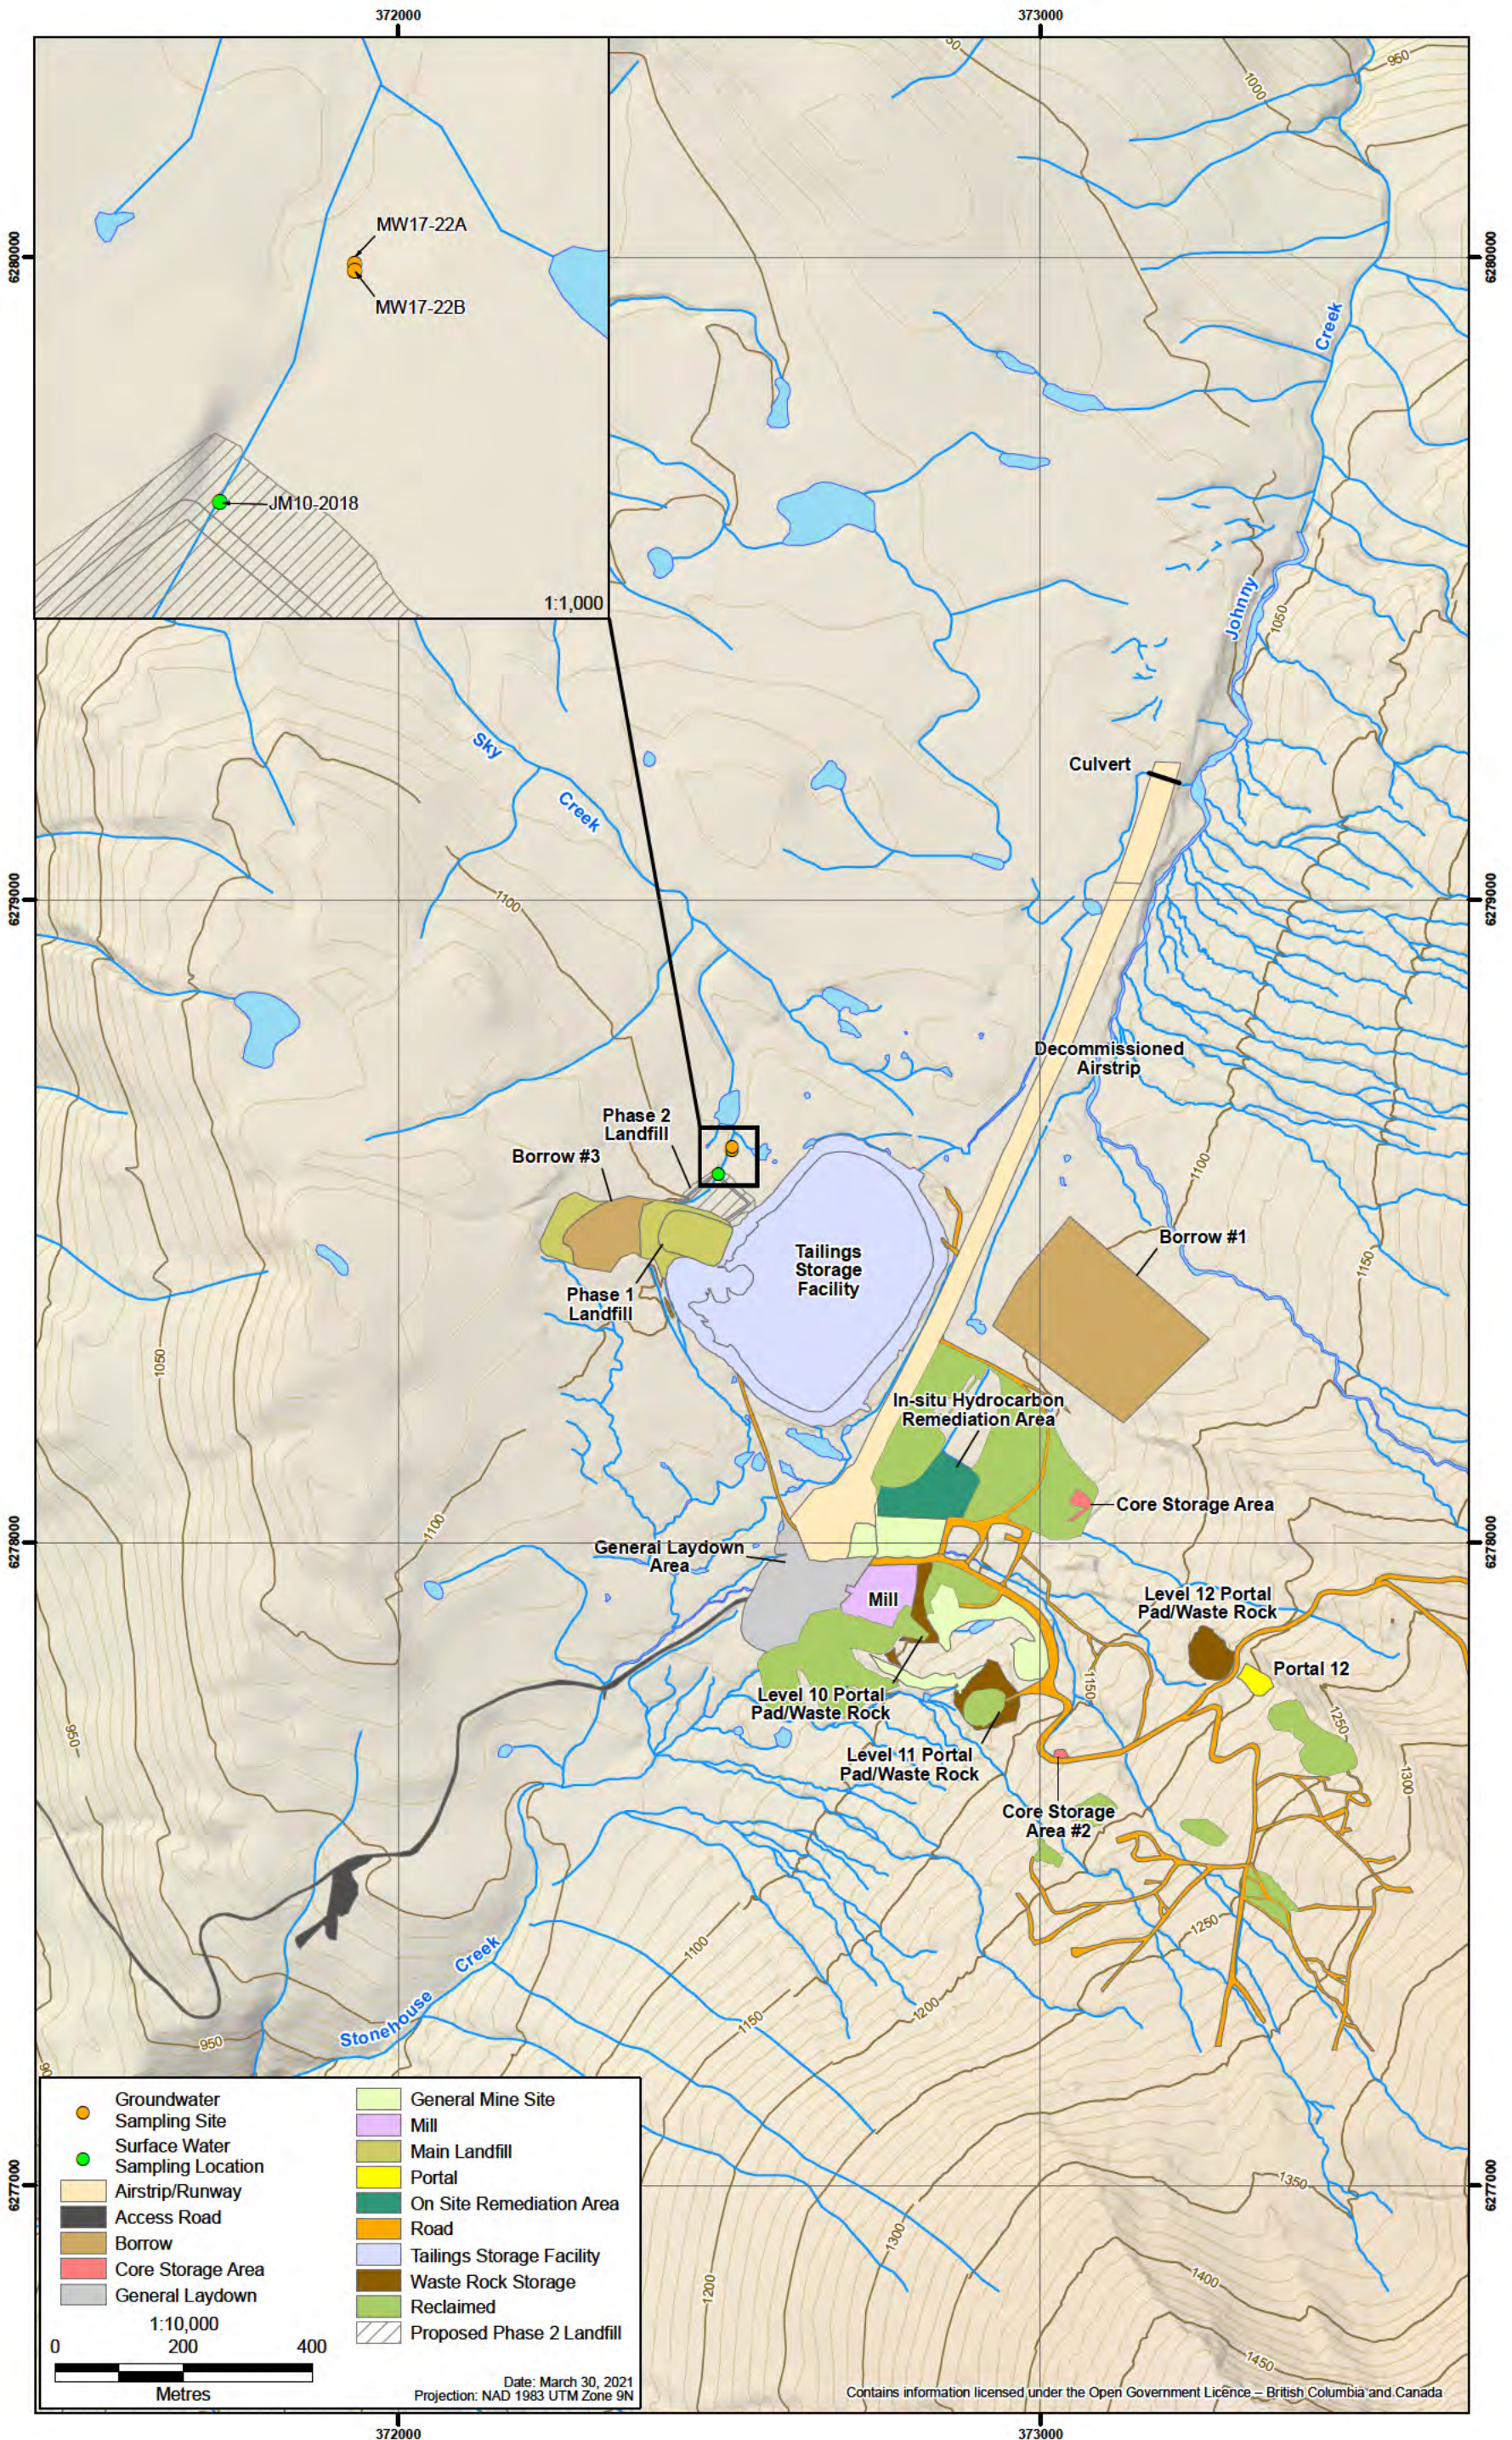

Figure 3.1-3  
Hydrometric Monitoring Locations

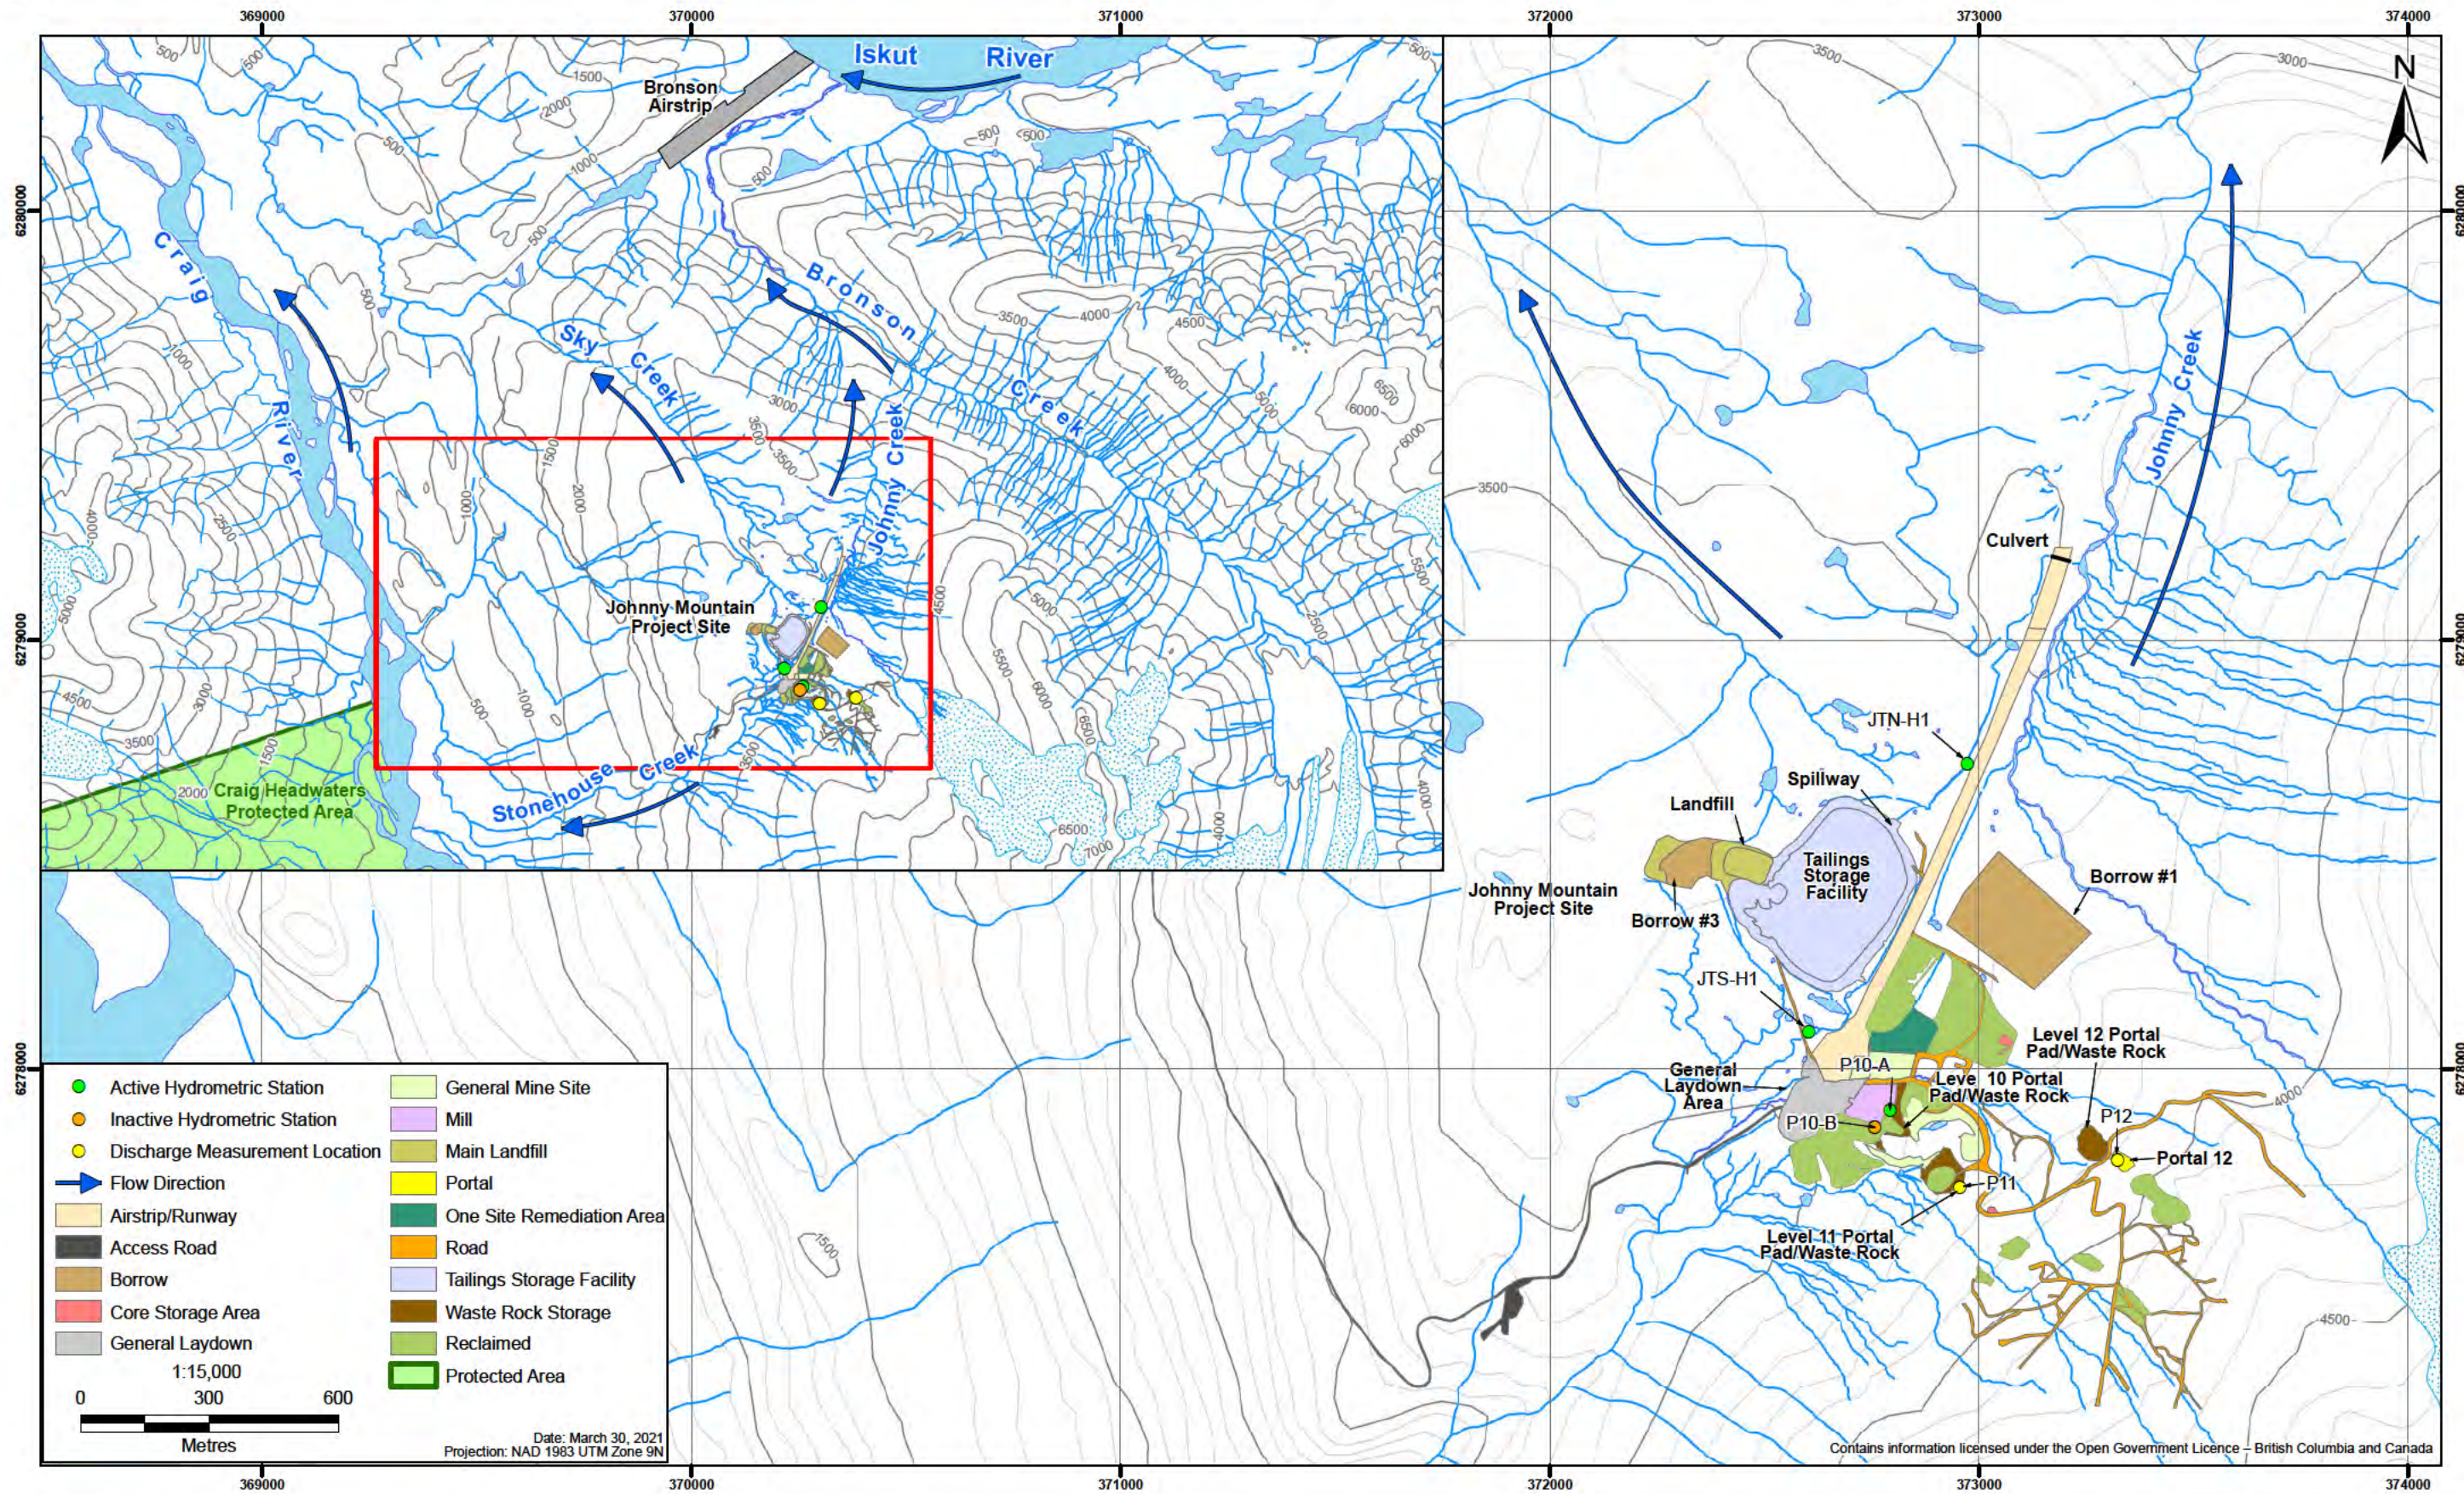

Table 3.1-4: Stage-Discharge Rating Equations

Station	Rating Equation <sup>1</sup>	Number of Rating Points Used in Curve Development	RMS Error <sup>2</sup> (Shift RMS)	Rating Period
JTS-H1	$Q = 4.015(h - 98.848)^{2.354}$	13	10.9	2016 - 2020
JTN-H1	$Q = 1.698(h - 99.494)^{1.947}$	13	7.1 (0.2)	2016 - 2020
P10-A	$Q = 1.339(h - 98.877)^{2.006}$	6	9.1	2019 - 2020

<sup>1</sup> Equation  $Q = C(h - a)^b$  :  $Q$  is the discharge ( $m^3/s$ ),  $C$  and  $b$  are dimensionless coefficients,  $h$  is the stage (m), and  $a$  is the stage at zero flow (m).

<sup>2</sup> RMS error is a statistical parameter that describes how well the values predicted by the stage-discharge relationship fit or represent the observed data, it is an indicator of uncertainty.

Daily discharge hydrographs were generated for the operational periods using the corrected stage records and rating curves for each station. These are presented in Appendix G (see Figures 3.3-1 to 3.3-3 of Appendix G), and include daily precipitation data collected at the Johnny Mountain meteorological station (UTM 371,942 E; 6,278,283 N; Zone 9V; NAD 83). The daily discharge tables for the hydrographs and historical discharge tables are also presented in Appendix G (See Appendixes B and D of Appendix G).

Annual hydrographs for the two automated hydrometric stations monitoring the TSF show a nival (snowmelt dominated) streamflow regime. The hydrographs are characterized by elevated streamflow during the spring freshet, when snow is melting, followed by a general decline in flow rate through the summer with periods of high flow resulting from precipitation events. Substantial peak events occurred in August as well as in the early fall, while a relatively warm and dry period in September saw a major decrease in stream flows.

Mean annual discharges were 0.020  $m^3/s$  at JTS-H1 and 0.007  $m^3/s$  at JTN-H1, while P10-A had an observed mean discharge of 0.010  $m^3/s$  during its operational period (Table 3.1-5). All stations experienced higher than average peak flows, with TSF monitoring stations experiencing discharges significantly higher than previous historical maximums. Likewise, summer low flows were near or greater than historical maximums, occurring in late September during a warm dry period.

Table 3.1-5: 2020 Mean Annual Discharge

Station	MAD ( $m^3/s$ )	Observed Average ( $m^3/s$ )
JTS-H1	0.020	0.045
JTN-H1	0.007	0.013
P10-A <sup>1</sup>	N/A	0.010

<sup>1</sup> A complete annual data series is not available for P10-A, value is based on the station's period of operation from June 14<sup>th</sup> through October 17<sup>th</sup>, 2020.

Annual daily peak flows are presented in Table 3.1-6. High flows were driven largely by snowmelt and heavy precipitation over the Project area in what was a wetter than average year (RTEC 2021c).

Summer low-flows (June to September) and annual low flows were calculated using the minimum 7-day average of daily flows. The summer low flows at each station occurred in late September and ranged from 0.003  $m^3/s$  at JTN-H1 to 0.006  $m^3/s$  at P10-A. In contrast to observed daily flow averages and peak flows, P10-A has the highest low flows rather than JTS-H1. Annual low flows occurred in early April when precipitation is stored in the snowpack and streamflows are dependent on available groundwater. Annual daily low flows ranged from 0.002  $m^3/s$  at JTN-H1 to 0.004  $m^3/s$  at JTS-H1. Annual daily low flows are not available for P10-A in 2020 as the station was not operational for the entirety of the year and as a

groundwater discharge monitoring location, is not suitable for modelling off of nearby stream data. The 7-day summer and annual low flows are presented in Tables 3.4-3 and 3.4-4 of Appendix G.

Table 3.1-6: 2020 and Historical Daily Peak Flow

Station Name	Daily Peak Flow (m <sup>3</sup> /s)				
	Observed 2016 to 2019 <sup>1</sup>			2020	Date
	Min	Mean	Max		
JTS-H1	0.004	0.050	0.155	0.190	20-Jun-20
JTN-H1	0.003	0.023	0.047	0.092	20-Jun-20
P10-A <sup>1</sup>	0.006	0.012	0.018	0.017 <sup>2</sup>	20-Jun-20

<sup>1</sup> Complete annual data series are not available for historic data, values are based on the stations period of operation during the open water season.

<sup>2</sup> A complete annual data series is not available for P10-A, values are based on the station's period of operation from June 14th through October 17th, 2020.

### 3.1.4 Groundwater Quality and Quantity

#### 3.1.4.1 Permit PR-7927 Groundwater Monitoring

Permit PR-7927 includes conditions for groundwater and surface water monitoring in the vicinity of the Main Landfill. Monitoring is required for a period of five years commencing in 2018. Hence 2020 reflects the third year of monitoring.

In addition to the surface water monitoring outlined in Section 3.1.3.1, the permit requires annual sampling at groundwater stations MW17-22A and MW17-22B. Table 3.1-7 summarizes the required groundwater monitoring sites, descriptions, locations, parameters and frequencies outlined in the permit and Figure 3.1-2 illustrates the sampling locations.

Table 3.1-7: Permit PR-7927 Groundwater Sampling Requirements

Monitoring Sites	Location Description	Coordinates	Monitoring Period, Parameters, and Frequencies	
			Water Quality	Water Level
MW17-22A (existing site)	Deep monitoring well downgradient from the Main Landfill.	372519, 6278611	A <sup>1</sup>	A
MW17-22B (existing site)	Shallow monitoring well downgradient from the Main Landfill.	372519, 6278610	A <sup>1</sup>	A

Note:

A = Annually (during summer)

<sup>1</sup> Field Parameters: specific conductivity, temperature, ORP (Oxidation-Reduction Potential), and pH. Analytical parameters: BTEX, EPH, PAH, dissolved metals, pH, alkalinity, bicarbonate, carbonate, chloride, conductivity (EC), fluoride, hardness, hydroxide, total iron, total magnesium, total manganese, nitrate, nitrite, ammonia, total potassium, total sodium, sulphate, TDS, TIC, TOC, COD and turbidity, acidity (hot peroxide titration) and cyanides (WAD, free, total, cyanate and thiocyanate).

Groundwater monitoring was completed on August 23 and 28, 2020, including the collection of groundwater quality samples and groundwater level measurements from the two nested groundwater wells, MW17-22A and MW17-22B. Water levels are presented in Table 3.1-8. Results of the Permit PR-7927 sampling can be found in Appendix F (RTEC 2021d) and are summarized in Section 3.1.4.2.

Table 3.1-8: 2020 Groundwater Levels Specified in Permit PR-7927

Well ID	Date Sampled	Groundwater Level (m btoc)	Bottom of Well Depth (m)
MW17-22A	28-Aug-20	0.905	11.83
MW17-22B	28-Aug-20	1.375	3.275

Notes:

**btoc = below top of the well's casing**

### 3.1.4.2 Groundwater Quantity

As part of the TSF groundwater monitoring program groundwater levels were measured at nine of the eleven groundwater monitoring wells. P89-01 was unable to be located and an accurate water level reading could not be taken at P89-03 due to well damage. (RTEC 2021d; Figure 3.1-4). Groundwater level measurements are presented in Table 3.1-9.

Table 3.1-9: August 2020 Johnny Mountain Tailings Management Facility Groundwater Level Measurements

Well ID	Easting <sup>A</sup> (m)	Northing <sup>A</sup> (m)	Water level (m)	Date	Notes
P88-01-1	372,497	6,278,243	0.000	24-Aug-20	
P88-01-2	372,497	6,278,243	0.000	24-Aug-20	
P88-01-alt1	372,498	6,278,248	0.200	29-Aug-20	
P88-02-1	372,659	6,278,136	0.146	24-Aug-20	
P88-02-2	372,659	6,278,136	0.582	24-Aug-20	
P88-03	372,870	6,278,308	1.442	24-Aug-20	
P88-04	372,871	6,278,534	0.000	29-Aug-20	
P89-01	372,710	6,278,244	n/a	29-Aug-20	Well was not located.
P89-02	372,702	6,278,248	0.000	24-Aug-20	PVC filled with silt.
P89-03	372,626	6,278,203	n/a	24-Aug-20	PVC damaged, water level reading could not be taken.
P89-06	372,720	6,278,226	1.426	24-Aug-20	

Notes:

### 3.1.5 Water Quality Prediction, Mitigation, and Treatment

Geochemical testwork activities completed in previous years for the JMM are described in Section 3.1.2. In 2020, water quality results from monitoring at JM5, the sampling site location downstream of the TSF spillway, did not exceed the authorized discharge characteristics under Permit PE-8415 (Section 3.1.3.1).

Figure 3.1-4

2020 Groundwater Levels Measurements for Standpipe  
Piezometers at the Johnny Mountain Tailings Storage Facility

A trial placement of PAG material excavated from the decommissioned airstrip was mixed with hydrated lime and was placed in two areas in the TSF to assess closure cover constructability. A total of 2,620 m<sup>3</sup> of waste rock mixed with 635 kg of hydrated lime was placed in the TSF in 2019. Due to the COVID-19 Pandemic, no heavy equipment was available on site, hence no waste rock was moved to the TSF in 2020. Relocation of waste rock to the TSF from the Level 10, 11, 12 portals is planned in 2021, as well as PAG waste rock located in isolated pockets on the decommissioned JMM airstrip and secondary access roads. All excavated waste rock will be mixed with hydrated lime to mitigate potential pH issues as the waste rock is placed below water elevation inside the TSF (Appendix C).

### 3.1.6 Water Management

The local and regional drainages can be seen on the local site map in Figure 3.1-3.

The TSF is the site water management infrastructure. Inputs that contribute to the water volume in the TSF are direct precipitation that falls on the TSF and drainage from the Main Landfill. There have been no substantial changes to the TSF water management in 2020. The TSF continues to be maintained with a water cover over the tailings and surplus water is passively decanted through a permanent spillway on the Northeast Dam. The spillway channel directs flow to an old polishing pond east of the dam and onward down Johnny Creek and Bronson Creek to Iskut River (Appendix H).

Small volumes of water seep through the TSF and are collected in surrounding ditches. Two hydrometric monitoring stations are in place to monitor this seepage. See Section 3.1.3.2 ‘Surface Water Quantity’ above for details.

A DSI was conducted on August 20, 2020 by Engineer of Record Neil K. Hemrajani Singh, P.Eng. of KCB and representatives of SnipGold (TSF Qualified Person Elizabeth Miller and the SnipGold representatives Jessy Chaplin, and Lionel Sequeira). In addition site inspections were conducted by Kevin Hidber of SnipGold on June 17, 2020 and August 1, 2020. Neil K. Hemrajani Singh, P.Eng. of KCB is the Engineer of Record for reporting to the EMLI. There were no significant changes to the TSF in 2020, and there were no significant changes to stability or surface water control. The spillway is in good condition (Appendix H; KCB 2021). The full dam safety inspection report including notes and recommendations can be found in Appendix H (KCB 2021).

No drainage improvements were undertaken in 2020. A Drainage Management Plan was prepared (RTEC 2021b, Appendix I) to address Conditions 3, 4(b), and 5 of Permit M-178:

*Condition 3: Drainage Monitoring: The Permittee shall implement a program to monitor and track changes to drainage chemistry from disturbed areas and waste materials. The program shall be capable of detecting significant metal leaching and provide early warning about the onset of ARD or increases in contaminant loadings. This program must specify the frequency, sampling type, location, parameters to be analysed, detection limits and QA/QC procedures and triggers for implementing additional mitigation works, and shall be submitted with the 2004 annual Reclamation Report due March 31, 2005, for approval by the Chief Inspector.*

*Condition 4(b): Drainage Management and Collection: The Permittee shall install weirs or other suitable flow measuring equipment at all water quality monitoring locations so that flows can be monitored when water quality monitoring is conducted.*

*Condition 5: Contingency Plans: Pursuant to condition 4 above, the Permittee must develop contingency plans demonstrating how contaminant loadings will be reduced, and receiving environment reclamation objectives will be achieved, should the underground and/or tailings mitigation strategies fail to protect against the onset of ML/ARD. Contingency Plans shall be described in the updated Closure Plan due March 31, 2005.*

The Drainage Management Plan describes monitoring and response for drainage discharging into the three primary drainages from the Johnny Mountain Mine: Johnny Creek that flows into Bronson Creek, Stonehouse Creek and Sky Creek. Passive discharge of water from the TSF and the portals is monitored to estimate flows at water quality monitoring locations as required by Condition 4(b) of Permit M-178. The water quality monitoring program under the Drainage Management Plan is designed to monitor and track changes to drainage chemistry from disturbed areas and waste materials, including the portal areas and the TSF. Monitoring results are assessed using Trigger Levels described in a Trigger Action Response Plan (TARP). The TARP is designed to detect significant metal leaching, provide early warning about the onset of ARD or increases in contaminant loadings, and specify triggers for implementing additional mitigation works, using numeric water quality thresholds for Level 1 “alert” Trigger Levels for additional investigation and Level 2 “action” Trigger Levels to ensure the receiving environment is not adversely affected.

### 3.1.7 *Erosion and Sediment Control*

Erosion and sediment control measures are carried out as part of reclamation activities at the JMM site. No mine reclamation works or landfill upgrades took place during 2020. However, Permit PR-7927 requires an annual inspection of erosion prevention and sediment control measures. On 29 August, 2020, the Main Landfill inspection was conducted in parallel with the 2020 Site Environmental Investigation (Wood 2021a and 2021b). SnipGold retained overall responsibility for implementation and maintenance of the erosion prevention and sediment control measures while Wood provided training, ongoing support, inspections, and assessment of the effectiveness of the controls.

As outlined in the 2020 site inspection record included in Appendix D, minor erosion, ponding and sedimentation deficiencies were noted. These include minor erosion on the north slopes of Cell 2, west slopes of Cell 1, and south slopes of Cell 2. Some metal was also exposed where surface water had eroded the interim cover material along the north slopes of Cell 2. Self armoring of gravel and cobbles in the silty kame material was observed in these erosional locations (Appendix D; Wood 2021b).

Additionally, minor ponding of water was observed in the following locations:

- Northeast access road of the Main Landfill;
- along the north edge of Cell 2; and,
- along the borrow area in the immediate southern edge of Cell 1, west of the culvert.

Since no construction work took place during 2020, it is recommended that this maintenance is addressed in 2021 prior to the continuation of any waste placement or landfill upgrades.

Wood reported the professional opinion that the Erosion Prevention and Sediment Control measures substantially comply with the plans and supporting documents referenced herein (Appendix D; Wood 2021b).

Water quality monitoring ultimately assesses the effectiveness of erosion and sediment controls. Results from the 2020 compliance water quality program indicated results comparable with nearby reference stations.

### 3.1.8 *Soil Salvage and Stockpiling*

There are no stockpiles of surface soil materials available for reclamation on site.

### 3.1.9 *In Situ Hydrocarbon Remediation Management*

#### 3.1.9.1 *Johnny Mountain Mine Environmental Site Investigations*

In 2020 the environmental site investigation continued on specific areas of potential environmental concern (APECs) and areas of environmental concern (AECs). The scope was modified as test pitting with an excavator could not be completed. Additionally, excavation of hydrocarbon contaminated soil for further soil remediation or mechanical aeration of treatment areas could not be completed in 2020. The modified 2020 objectives to support ongoing Site reclamation work included:

- Continue an environmental site investigation of specific AECs and APECs to assess hydrocarbon impacts in groundwater within the following APECs/AECs:
  - AEC 1 (APEC 1): Mill/10 Level Portal;
  - AEC 2 (APEC 2 / APEC 14) : Tank Farm and Fuel Lines and AEC 3 (APEC 4) - Fuel Pump Shed;
  - AEC 5 (APEC 9): Main Landfill; and
  - Tailings storage facility (TSF).
- Evaluation of petroleum hydrocarbon levels in material located in the Treatment Areas 1 and 2 by hand digging test pits into the material;
- Continuing evaluation of background concentration of metals in groundwater by completing additional groundwater monitoring and sampling activities; and
- Collection of groundwater quality data at the Main Landfill, required to support annual compliance reporting requirements for Permit PR-7927.

#### Areas of Environmental Concern (AECs) and Areas of Potential Environmental Concern (APECs)

An initial Site Investigation in 2017 followed by annual Supplemental Site Investigations (SSIs) have been completed to investigate areas of potential environmental concern (APECs) relating to historic mining operations (AMECFW 2018; Wood 2019, 2020, 2021b). Results indicating that there was contamination present related to former operations were carried forward as areas of environmental concern (AECs).

Based on the result of the 2020 SSI, which focused on the assessment of hydrocarbon impacts in groundwater, there are nine APECs/AECs at the JMM to be carried forward for additional assessment and/or remediation work:

- AEC 1 (APEC 1): Mill / 10 Level Portal
- AEC 2 (APEC 2 / APEC 14): Tank Farm Area / Fuel Lines
- AEC 3 (APEC 4): Fuel Pump Shed
- AEC 4 (APEC 5): Mechanical Shop / 11 Level Portal
- AEC 5 (APEC 9): Main Landfill
- AEC 6 (APEC 11): Airstrip
- AEC 7 (APEC 13): Warehouse East Area
- APEC 10: Burial Site #1 (Former Chalet)
- APEC 12: Burial Site #2

All data, results, analysis and mapping for AECs are presented in detail within Appendix J.

#### Petroleum Hydrocarbons - Groundwater

Groundwater samples collected from monitoring wells MW17-04A, MW17-04B, MW17-06A, MW17-06B, MW17-07A, MW17-07B, MW17-12A, MW17-12B, MW17-13, MW17-17A, MW17-22A, MW17-22B, MW17-20A, MW17-20B and MW17-23A were submitted for analysis of BTEX, PAHs and LEPH/LEPHs. Groundwater sample MW17-17A was also submitted for analysis on VPHs and samples MW17-22A and MW17-22B were also submitted for analysis VOCs. A synopsis of the analytical results is as follows:

- Groundwater sample MW17-4B, located within APEC 1/AEC 1 (Mill and 10 Level Portal), contained elevated concentrations of methyl-naphthalene and LEPH<sub>w</sub>
- Groundwater sample MW17-6B, located within APEC 1/AEC 1 (Mill and 10 Level Portal), contained elevated concentrations of acenaphthene and methyl-naphthalene,
- Groundwater sample MW17-12A, located within APEC 14/AEC 2 (Fuel Lines), contained an elevated concentration of LEPH<sub>w</sub>,
- Groundwater sample MW17-17A, located within APEC 14/AEC 2 (Fuel Lines), contained an elevated concentration of methyl-naphthalene.
- Groundwater sample MW17-20A, located downstream of the TSF, contained elevated concentrations of methyl-naphthalene and naphthalene.
- Groundwater samples collected from monitoring well MW17-22A, located at the Main Landfill, contained elevated concentrations of ethylbenzene, methyl-naphthalene and naphthalene.
- A light non-aqueous phase liquid (LNAPL) (measurement of 1 cm) was measured with a Heron interface probe within monitoring well MW17-17B located within APEC 14/AEC 2 (Fuel Lines). The presence of LNAPL was also verified visually with a bailer.

#### Petroleum Hydrocarbons Results - Discussion

Based on a threshold of five times the laboratory method detection limit (MDL) to define elevated concentrations for discussion purposes, groundwater impacted by petroleum hydrocarbons was identified at AEC 1 (APEC 1) and AEC 2 (APEC 2 / APEC 14). LNAPL was identified at monitoring well MW17-17B. Soil impacted by petroleum hydrocarbons was also identified within these AECs during previous assessments. Soil contamination identified within those AECs has impacted groundwater quality.

Elevated concentrations of methyl-naphthalene and naphthalene were observed downstream of the TSF (MW17-20A) in the 2020 sampling event; however, they were lower than the previous groundwater sampling events completed in July and October 2017. The groundwater quality in that area seems to have improved since 2017. Natural attenuation is likely occurring and concentrations of PHCs appear to be decreasing with time.

Elevated concentrations of ethylbenzene, methyl-naphthalene and naphthalene were observed downstream of the Main Landfill (APEC 9/AEC 5) (MW17-22A); however, they were lower or within the same range than the previous groundwater sampling events completed in July and October 2017, July and September 2018 and July 2019. The groundwater quality in that area seems to have improved since 2017. Natural attenuation is likely occurring and concentrations of PHCs appear to be decreasing with time.

### 3.1.9.2 *In-situ Hydrocarbon Remediation*

In-situ remediation of petroleum hydrocarbon soil contamination in the area of the Fuel Tank Farm and Fuel Lines (AEC 2 (APEC 2 / APEC 14)) was commenced by NorthWest Response (NWR) during the 2018 and 2019 field season. As a result of the remediation program, there is a stockpile of soil excavated in 2018 that contains approximately 3,000 m<sup>3</sup> of soil, hereafter referred to as Treatment Area 1. Treatment Area 1 is located in the Fuel Line area portion of AEC 2. In 2019 an additional 6,000 m<sup>3</sup> of soil was excavated in 2019 from AEC 2 and placed into a stockpile, hereafter referred to as Treatment Area 2. Treatment Area 2 is located in the former Tank Farm portion of AEC 2.

Wood’s 2020 scope of work included the completion of year-end sampling of Treatment Area 1 and Treatment Area 2 to determine the effectiveness of the remediation program. The treated soil was evaluated for petroleum hydrocarbon constituents, nutrients, moisture content, pH and hydrocarbon utilizing bacteria (HUB). Based on the results of the 2020 soil sampling and the data collected during the 2017 Site Investigation (2017 SI), 2018 SSI and 2019 SSI, concentrations of light extractable petroleum hydrocarbons (LEPH) have decreased significantly as shown in Tables 3.1-10 and 3.1-11 (Supplemental Site Investigation Appendix J).

Table 3.1-10: Treatment Area 1 - 95<sup>th</sup> Percentile Over Time

Sampling Event	95 <sup>th</sup> Percentile (mg/kg)	Average Concentration (mg/kg)
2017 In-Situ (LEPH)	3748	3138
2018 (Year End) LEPH	3582	1857
2019 (Mid-Year) LEPH	2005	1217
2019 (Year End) LEPH	1394	738
2020 (Year End) LEPH	1164	710

Table 3.1-11: Treatment Area 2 - 95<sup>th</sup> Percentile 2020 Year End Sampling

Sampling Event	95 <sup>th</sup> Percentile (mg/kg)	Average Concentration (mg/kg)
2017 In-Situ (LEPH)	3748	3138
2019 (Year End) LEPH	2772	1619
2020 (Year End) LEPH	1292	813

### 3.1.9.3 *Background Groundwater Assessment*

From 2017 to 2020, the site investigations and supplementary site investigations conducted by Wood have included groundwater sampling (AMECFW 2018; Wood 2019, 2020, 2021b). The groundwater sampling was intended to capture potential trends in groundwater quality in the areas around the two disposal sites, Mill Building, Old Tank Farm, and Main Landfill. Results of the groundwater sampling, maps and information on other aspects of the site investigation can be found in the appended Wood 2020 *Supplementary Environmental Site Investigation Report* (Wood 2021b; Appendix J). The following results summary was provided by Wood (2021b), and the full report with the analytical results is available in Appendix J.

#### 2020 Activities

On August 23-28, 2020, Wood collected groundwater samples from 28 monitoring wells in addition to samples collected at MW17-22A and MW17-22B, located downgradient from the Main Landfill, to satisfy

the requirements for Permit PR-7927, which authorizes the discharge of waste to the Main Landfill. Further information on monitoring, sampling, and QA/QC of these groundwater samples is provided in Appendix J (Wood 2021b).

### 2020 Results

The 2017 to 2020 field investigations identified elevated concentrations of dissolved metals: aluminum, antimony, cobalt, manganese, cadmium, copper, lithium, iron, uranium and arsenic in groundwater. An assessment of background concentrations of dissolved metals has indicated that antimony, arsenic, uranium, iron, lithium, cobalt and manganese are elevated compared to background concentrations and could be attributed to historical mining activities. Wood observed that the concentrations of dissolved metals are generally decreasing over time. When compared to the BC Contaminated Sites Regulation (CSR), many of the dissolved metals concentrations that are elevated are still less than BC Contaminated Site Regulation (CSR) aquatic life (AW<sub>F</sub>) water use standards. Based on observed concentrations compared to background, manganese appears to be the remaining dissolved metal that would require further assessment (Wood 2021b).

Elevated dissolved concentrations of manganese appear to be associated with the AEC 1 (APEC 1) - Mill Building and 10 Level Portal; however, elevated manganese was also identified at APEC 10 - Burial Site # 1, APEC 12 - Burial Site # 2 and at AEC 2 (APEC 2 / APEC 14) - Tank Farm and Fuel Line area. The locations where elevated manganese was identified were all in disturbed areas and the highest concentrations were found around the AEC 1 (APEC 1) - Mill Building and 10 Level Portal.

Please refer to Appendix J for additional maps, figures and details.

#### *3.1.10 Vegetation Management*

In July 2019, a set of revegetation trials was established at the north end of the decommissioned airstrip. The northern end of the airstrip was selected to conduct the reclamation trials because it is relatively isolated from the historical mine area and is unlikely to be disturbed by other reclamation activities. The airstrip is also the largest single feature that will be reclaimed at 5.27 ha. The trials initiated in 2019 were monitored in July and September 2020. A report is presented in sub-section 4.1.4 below and Appendix K (Johnny Mountain Mine Revegetation Monitoring 2020).

#### *3.1.11 Wildlife Protection*

The Goat Management Plan that was prepared in 2016 continues to be implemented. The Plan aims to protect goats from potential negative effects of helicopter overflights. A PowerPoint slide presentation was developed in 2016 (RTEC 2016) and continues to be used for pilots and other personnel doing work in the area.

Following the recommendations from the JMM marmot den survey conducted in the area of the Main Landfill and borrow areas in 2018 (RTEC 2018a), required excavation activities are carried out at a slower than normal pace around the previously observed den areas, in order to give potential transient marmots an opportunity to escape. It was also a recommendation of the survey findings that the field crew appoint a spotter when working close to known marmot dens. Large boulders could also be moved to undisturbed areas of site, where they may act as attractants to marmots. Although not required for site activities in 2020, these recommendations will be considered for future activities conducted on site.

Best management practices are used to avoid or minimize wildlife-human interactions, such as management of garbage and waste, and regular communication check-ins for field staff.

### 3.1.12 *Archeological Resources*

In 2019 an Archeological Impact Assessment (AIA) report was prepared that summarized archaeological assessments that have taken place from 2016 to 2019 (RTEC 2020c). The AIAs were carried out under *Heritage Conservation Act* Heritage Inspection Permit 2016-0229. No further archaeological assessment was performed in 2020.

Based on the AIAs the following general management recommendations were provided:

- On the steep north facing slope down to Bronson Creek within Exploration Focus Area A no further archaeological assessment is required, however, if impacts are anticipated at the top of the slope additional assessment will be required.
- No further archaeological assessment is recommended within Exploration Focus Area B, which encompasses the majority of the historical mine area.
- The area around the Meteorological Station was assessed (20 metre radius), no archaeological concerns were identified, and no further work is required.

Even the most thorough study may not identify all archaeological resources that may be present and **SnipGold's Archaeological Chance Find Procedure should continue to be implemented prior to the commencement of ground altering activities.** All staff on site should be familiarized with the procedure and protocols for managing known archaeological sites and any chance finds that may occur during construction.

The management recommendations presented above are offered by RTEC and are subject to review and acceptance by the Archaeology Branch.

### 3.1.13 *Meteorological Station*

A meteorology station was installed on the plateau in September 2016 and continued to operate through 2020. The station is collecting local information for wind speed, direction, temperature, humidity, solar radiation, snow depth, and precipitation. The station includes a network camera and satellite telemetry connection, and hosts an online website to display up-to-date and historical data. A detailed description of the station and information collected to date can be found in Appendix B (RTEC 2021a).

During the monitoring period of August 2016 to October 2020, average air temperature was 0.8°C with daily average temperature ranging from 19.6°C (June 19, 2018) to -24.4°C (February 2, 2019). The mean relative humidity records indicate that fog and low clouds were present at the Johnny Mountain plateau approximately 36% of the time during the reporting period. The monthly average total precipitation adjusted for wind undercatch ranged from 86 mm in April to 237 mm in November, and the maximum daily precipitation recorded during the monitoring period was 66 mm on January 1, 2019. Missing daily temperature and precipitation data were estimated using regression analysis with data from the KSM Project meteorological stations. The estimation methodology was found to be satisfactory to predict missing daily temperature and precipitation data. The snow season typically extends from October to May and the snowpack reaches its maximum depth in March or April. The maximum daily snowpack depth during the monitoring period was 220 cm recorded on March 16, 2020.

Winds were predominantly from the southwest quadrant during warm months and from the northeast during the wintertime. Northeastern winds were characterized by higher speeds. The average wind speed during the period of record was 4 m/s while 33% of time the wind speed ranged from 3 to 5 m/s.

Calm winds occurred 1.7% of time. The maximum hourly average wind speed was 30 m/s (108 km/h) and the maximum wind gust speed was 45.1 m/s (162 km/h), both occurred on January 15, 2020. The hourly average solar radiation ranged from 0 to 990 W/m<sup>2</sup>, peaking during the summer.

### 3.1.14 *Tahltan Engagement*

The following engagement activities were conducted in 2020:

- The Seabridge annual environmental program update meeting was held on June 9 and June 10, 2020 (via video conference due to COVID-19) to present the JMM Reclamation work summary. The attendees included representatives of Seabridge (Elizabeth Miller, Kevin Hidber and Taryn Cutler), Environment and Climate Change Canada (ECCC) (Yee Ting Choy), the Ministry of Environment (ENV) (Mark Love and Lisa Torunski), EMPR (Martina Bezzola and Lowell C), RTEC (Wade Burnham, Eri Ratwanati, Kelsey Norlund, Jill Zyla and Coby Hall), Wood (Jeremiah Gladu and Mario Bianchin), Golder Associates (Kristin Salzsauler), Skeena Fisheries - Gitanyow (Kyla Warren), Nisga'a Government (Tracey McKay and Kathryn McLeod), Tahltan Central Government (TCG) (Nailaine Morin), Alaska Department of Environmental Conservation (DEC) (Allan Nakanishi and David Khan), Alaska Fisheries Department (DFG) (Kate Kanouse), and Alaskan Department of Natural Resources (DNR) (Kyle Moselle) (RTEC 2021e).
- In 2020 a co-authored paper on JMM reclamation was presented to The British Columbia Technical and Research Committee on Reclamation (TRCR) by TCG and SnipGold Corp.
- TCG attended the annual SnipGold presentation to EMLI in Feb 2020 in Victoria.

### 3.2 Next Year: 2021 Planned Activities

The planned 2021 reclamation season involves the following:

- PAG relocation to the TSF;
- continued in-situ soil remediation of contaminated soils located within the historic tank farm and a portion of the JMM airstrip;
- place all miscellaneous site equipment into expanded landfill (grader, crane, D6 dozer and snow cat);
- excavation and relocation of any additional undocumented waste sites to the JMM Landfill;
- ongoing environmental monitoring;
- ongoing dam safety inspections (DSI) on the TSF;
- seeding and vegetating of disturbed areas; and
- upgrade to the JMM access road as required.

#### 3.2.1 *Environmental Management Systems/Plans/Audit*

No new environmental management systems, plans or audits are planned for 2021. SnipGold have developed a Project Execution Plan for 2021 (Appendix C) which aligns with the objectives of the overall JMM PEP and JMM Closure Plan.

### 3.2.2 *ML/ARD Characterization and Mine Waste Management*

The primary goal of the 2021 season is the excavation and relocation of ML/ARD waste rock from the Level 10, 11, 12 portals, as well as waste rock located on the JMM airstrip and secondary access roads surfaced with waste rock (see Table 3.2-1 below). All excavated waste rock will be mixed with hydrated lime to add neutralization potential and prevent the release of dissolved metals as the waste rock is placed below water elevation inside the TSF (for more details see the Project Execution Plan for 2021 in Appendix C).

Table 3.2-1: Estimated Volume of Waste Rock to relocate per area

Area	Volume (m <sup>3</sup> )
Level 10	37,500
Level 11	26,500
Level 12	12,500
JMM Airstrip	5,000
Secondary access roads	4,000
Total (Estimated) waste rock	85,500

### 3.2.3 *Surface Water Quality and Quantity Monitoring*

#### 3.2.3.1 *Surface Water Quality*

Surface water quality monitoring will be carried out in 2021 in accordance with requirements of permits PE-8415 and PR-7927.

#### 3.2.3.2 *Surface Water Quantity*

Surface water quantity monitoring will be carried out in 2021.

### 3.2.4 *Groundwater Quality and Quantity*

The compliance groundwater sampling for Permit PR-7927 will be carried out as required during the snow-free period in 2021. Groundwater level measurements of the wells around the TSF will be completed as part of the TSF groundwater monitoring program.

### 3.2.5 *Water Quality Prediction, Mitigation, and Treatment*

There are no plans for a water quality prediction program in 2021. Water quality sampling will be carried out for Permit PE-8415 and Permit PR-7927. The main mitigation and treatment measure for water quality on site is to relocate PAG waste rock to the TSF water cover from the Portals #10, 11, 12, and isolated pockets from the decommissioned airstrip and secondary roads, following the treatment procedures outlined in Permit M-178. The relocation of this material is planned for 2021, and will likely continue into 2022.

### 3.2.6 *Water Management*

The TSF will continue to be inspected on an annual basis. Permit M-178 requires the permittee to prepare a Dam Safety Inspection Report for the TSF every two years (or annually should a yearly field

inspection of the TSF not be undertaken), and Dam Safety Reviews (DSR) every 10 years (superseded by the Mines Act and Code which since 2014, require all TSFs to have a DSI annually and a DSR every five years. The two hydrometric stations collecting seepage from the TSF will be installed again in 2021, and hydrometric monitoring at the three portals will continue. There may be active management of water within the TSF during the relocation of waste rock in an effort to control the quality of surface water existing in the TSF during the activities planned for 2021. In 2021, water management activities will include maintenance of effective surface water diversions around the mill building, maintenance of collection channels to effectively maintain drainage across the site and control sedimentation, and mitigate erosion (Appendix C).

### 3.2.7 *Erosion and Sediment Control*

The site is subject to approximately 2,000 mm of precipitation as well as added and concentrated flows from the local melting glaciers. Spring/summer flows can also be significant with melting of the accumulated snow pack in the area. Many ditches and swales have been installed over the 2017 and 2018 reclamation season to manage surface flows and direct runoff water toward historic channels. The 2021 season will be a continuation of the overall water management plan, including re-establishing effective surface water diversions around the Mill Building area, re-establishment of collection channels to effectively maintain drainage across the site and control sedimentation, and mitigate erosion (Appendix C; Project Execution Plan [PEP]; SnipGold 2021).

Current best practices and/or guidelines from agencies will be followed when moving waste rock is undertaken in 2021. Water quality monitoring will take place in 2021 as described above, which assesses the effectiveness of erosion and sediment controls.

### 3.2.8 *Soil Salvage and Stockpiling*

There are no plans to stockpile soils in 2021.

### 3.2.9 *In Situ Hydrocarbon Remediation Management*

An estimated soil volume of 9,000 m<sup>3</sup> was treated within the JMM tank farm area in 2020. 2021 will continue with treatment of contaminated soils within the historical JMM tank farm and a portion of the JMM airstrip. Fertilizer and a natural biocatalyst (oil Gator) may be added to the soils and turned several times during the 2021 season to speed aeration and the treatment process (Appendix C).

In regards to the groundwater site investigation sampling program, Wood recommended that select groundwater wells are sampled and analyzed to supplement the existing groundwater data set (Appendix J). Wood also provided recommendations on which APECs/AECs should be carried forward for additional assessment and/or remediation work in 2021 (Appendix J). Based on the results of the 2020 SSI, the following APECs/AECs in the table below (Table 3.2-2) are recommended to be carried forward for additional assessment and/or remediation work. More details are provided in Appendix J.

### 3.2.10 *Vegetation Management*

The 2019 vegetation trial established on 0.8 ha of the northern end of the decommissioned airstrip will be monitored in 2021 to evaluate the success of the establishing of native vegetation.

Table 3.2-2: Summary of AECs/APECs and Contaminant Type

Initial APEC	Description	2019 Classification	Contaminant Type
APEC 1	Mill / Portal 10	AEC 1	Diesel fuel and lubricants
APEC 2 / APEC 14	Tank Farm Area / Fuel Lines	AEC 2	Diesel fuel, aviation fuels and possibly gasoline, waste rock
APEC 4	Fuel Pump Shed	AEC 3	Diesel fuel and Avgas
APEC 5	Mechanical Shop / Portal 11	AEC 4	Fuels, lubricants, and waste rock storage
APEC 9	Main Landfill	AEC 5	Inferred to be diesel fuel
APEC 10	Burial Site 1 (Fmr. Chalet)	APEC 10	Waste rock
APEC 11	Airstrip	AEC 6	Waste rock
APEC 12	Burial Site #2	APEC 12	Contents of burial site, waste rock
APEC 13	Warehouse East Area	AEC 7	Stored / used fuel and lubricants

### 3.2.11 *Wildlife Protection*

The Goat Management Plan will continue to be implemented in 2021. Best management practices will continue to be used to avoid or minimize wildlife-human interactions, such as management of garbage and waste, and regular communication check-ins for field staff.

### 3.2.12 *Archaeological Resources*

Archeological baseline work may be conducted if any new exploration areas are identified, or if any activities are anticipated to take place outside of the areas already assessed.

### 3.2.13 *Meteorological Station*

For 2021, it is anticipated that the meteorological station will be maintained, winterized, and kept in good working condition so that remote access to data is maintained.

### 3.2.14 *Tahltan Engagement*

SnipGold will continue to engage with Tahltan Nation representatives in 2021, where appropriate, in order to keep all parties well informed on the on-going efforts by SnipGold to reclaim and remediate the JMM site.

## 3.3 Next Five Years: Summary 2021-2025

Environmental programs and monitoring required through the JMM permits (i.e., *Mines Act* Reclamation Permit M-178, *EMA* Permit PE-8415, and *EMA* Permit PR-7927) will continue, as necessary. Annual reports documenting associated activities will be provided as required.

SnipGold will continue to implement relevant management and monitoring plans required for the JMM site and associated activities, for example the ML/ARD Monitoring Plan, Closure Management Manual, etc.

Achieving the approved closure and reclamation objectives will remain the priority of SnipGold and SnipGold will continue to develop detailed Project Execution Plans for each year of activity. The key objectives being:

- Removal of infrastructure and cleanup of the JMM site;
- Decompact disturbed lands to enable development of natural habitat for wildlife utilization; and
- Establish long-term stability of restored areas, biologically, geotechnically and geochemically.

Through this time SnipGold will maintain a controlled, safe and secure site, where safety and safe work practices are of paramount importance.

## 4. RECLAMATION PROGRAM

### 4.1 Past Year: 2020 Activities

No reclamation activities were completed in 2020. Activities during the 2020 season were limited to permit compliance and environmental monitoring.

#### 4.1.1 *End Land Use*

The overall objective of the reclamation and closure plan for the Johnny Mountain Mine is to return disturbed lands and anthropogenic landforms to their original land use and capability of alpine tundra wildlife habitat (Woznow and Yeager 1999). This aligns with the end land use requirement specified in Permit M-178. As described in Section 1.5 of this report, the target wildlife species associated with the end land use of alpine tundra wildlife habitat are marmots, mice, voles, and shrews, and their transient predators, including marten and grizzly bears.

The end land use proposed in Permit M-178 is alpine tundra wildlife habitat, and it remains as the objective for future reclamation efforts.

#### 4.1.2 *Land Capability*

The capability condition specified in Permit M-178 is as follows: *Excluding the tailings pond area, the average land capability to be achieved on the remaining lands shall not be less than the average that existed prior to mining.*

The land capability as specified in Permit M-178 will remain the capability objective for future reclamation efforts.

##### 4.1.2.1 *Pre-Disturbance Landscape*

In addition to historical information, LiDAR (Light Detection and Ranging), historical airphotos, and recent imagery were used to identify pre-disturbance ecosystems and conduct a desk-based Terrestrial Ecosystem Mapping (TEM) of the areas adjacent to the site (RTEC 2018b). The historical airphotos were georeferenced in ArcMap and used in combination with more recent imagery and LiDAR to create the TEM. The ecosystem types and boundaries were delineated based on the interpretation of the imagery and LiDAR and on site units described in *A Field Guide to Site Identification and Interpretation for the Prince Rupert Forest Region* (Banner et al. 1993) and the *Biogeoclimatic Ecosystem Classification (BEC) of Non-Forested Ecosystems in British Columbia* (MacKenzie 2012). In areas disturbed by the former mine, ecosystems were delineated and identified using the historic airphotos. Two BEC zones were identified: the MHmm2p which occurs in the transition from treeline to the alpine; and the CMAun which is the true alpine zone and is not treed (Figure 4.1-1).

Within each BGC Unit, site units were mapped. Site units reflect a recurring pattern of variation in soil and physiographic properties. Site units are grouped according to their potential to produce similar “stable” plant communities as influenced by environmental properties such as soil moisture and soil nutrient regimes.

Almost one-third of the mapped area is comprised of non-vegetated morainal till and rock, upslope of the Mill Building and the decommissioned Airstrip/Runway, which reflects the relatively recent retreat of the glacier from the higher elevations.

The MHmm2 parkland unit is the most common. However, due to cold air drainage, trees are not present on most sites. The majority of the MHmm2p site is Sedge Meadows (SS) followed by Heather Meadows (HM). There are minor amounts of Mountain Heather Parkland (i.e., contains gappy open trees) (MH) and Mountain hemlock - Sedge Meadows (SH), and non-vegetated morainal deposits (MN).

The CMAun occurs above the TSF and airstrip, and is comprised of non-vegetated recent morainal till (MN), Mountain Heather Meadows (MM), Alpine Meadow (AM), and sparsely vegetated Mountain Heather - Rhacomitrium Scrub (MR).

#### 4.1.2.2 Existing Landscape

The JMM site is located in a rugged area at approximately 1,100 to 1,200 m above sea level (masl). Surrounding peaks are up to 2,000 m in elevation. Much of the site above the airstrip is located on morainal till deposits exposed by the receding glacier. The deglaciated areas typically have limited, if any, soil development; where present, soils are derived from glacial till and colluvium.

The site is located in the subalpine parkland of the Mountain Hemlock moist maritime subzone leeward variant (MHmm2p) and in the Coastal Mountain-heather Alpine (undifferentiated; CMAun) Biogeoclimatic Zone (BGC) zone. Due to the cold air drainage from the glacier coniferous trees are largely absent and most of the area is comprised of heathers, herbs, and low shrub species. These BGC units have some of the harshest climates of any of the biogeoclimatic zones in British Columbia. Temperatures remain low even during the growing season, which has a short frost-free period.

Plant species located near the mine site include: *Leutkea pectinata* (partridgefoot), *Phyllodoce empetrififormis* (pink mountain-heather), *Cassiope mertensiana* (white mountain-heather), *Empetrum nigrum* (crowberry), *Veratrum viride* (Indian hellebore), *Festuca altaica* (altai fescue), *Epilobium latifolium* (willow herb), *Epilobium angustifolium* (fireweed), *Senecio triangularis* (arrow-leaved groundsel), *Alnus viridis ssp. Sinuate* (green alder); *Tsuga mertensiana* (mountain hemlock), *Tsuga heterophylla* (western hemlock), and *Chaemaecyparis nootkensis* (yellow cedar).

#### 4.1.3 Long-term Stability

The long-term stability condition specified in Permit M-178 is as follows: *Land, watercourses and access roads shall be left in a manner that ensures long-term stability.*

The access road to the site from the Bronson airstrip needs to remain active for ongoing reclamation and exploration activities.

The long-term stability of the tailings dam was considered by conducting the required annual dam safety inspection in 2020 (Appendix G; KCB 2021). A dam breach analysis and consequence classification update was conducted in 2017 (KCB 2018a), and an updated closure design for the TSF was prepared in 2018 (KCB 2018b).

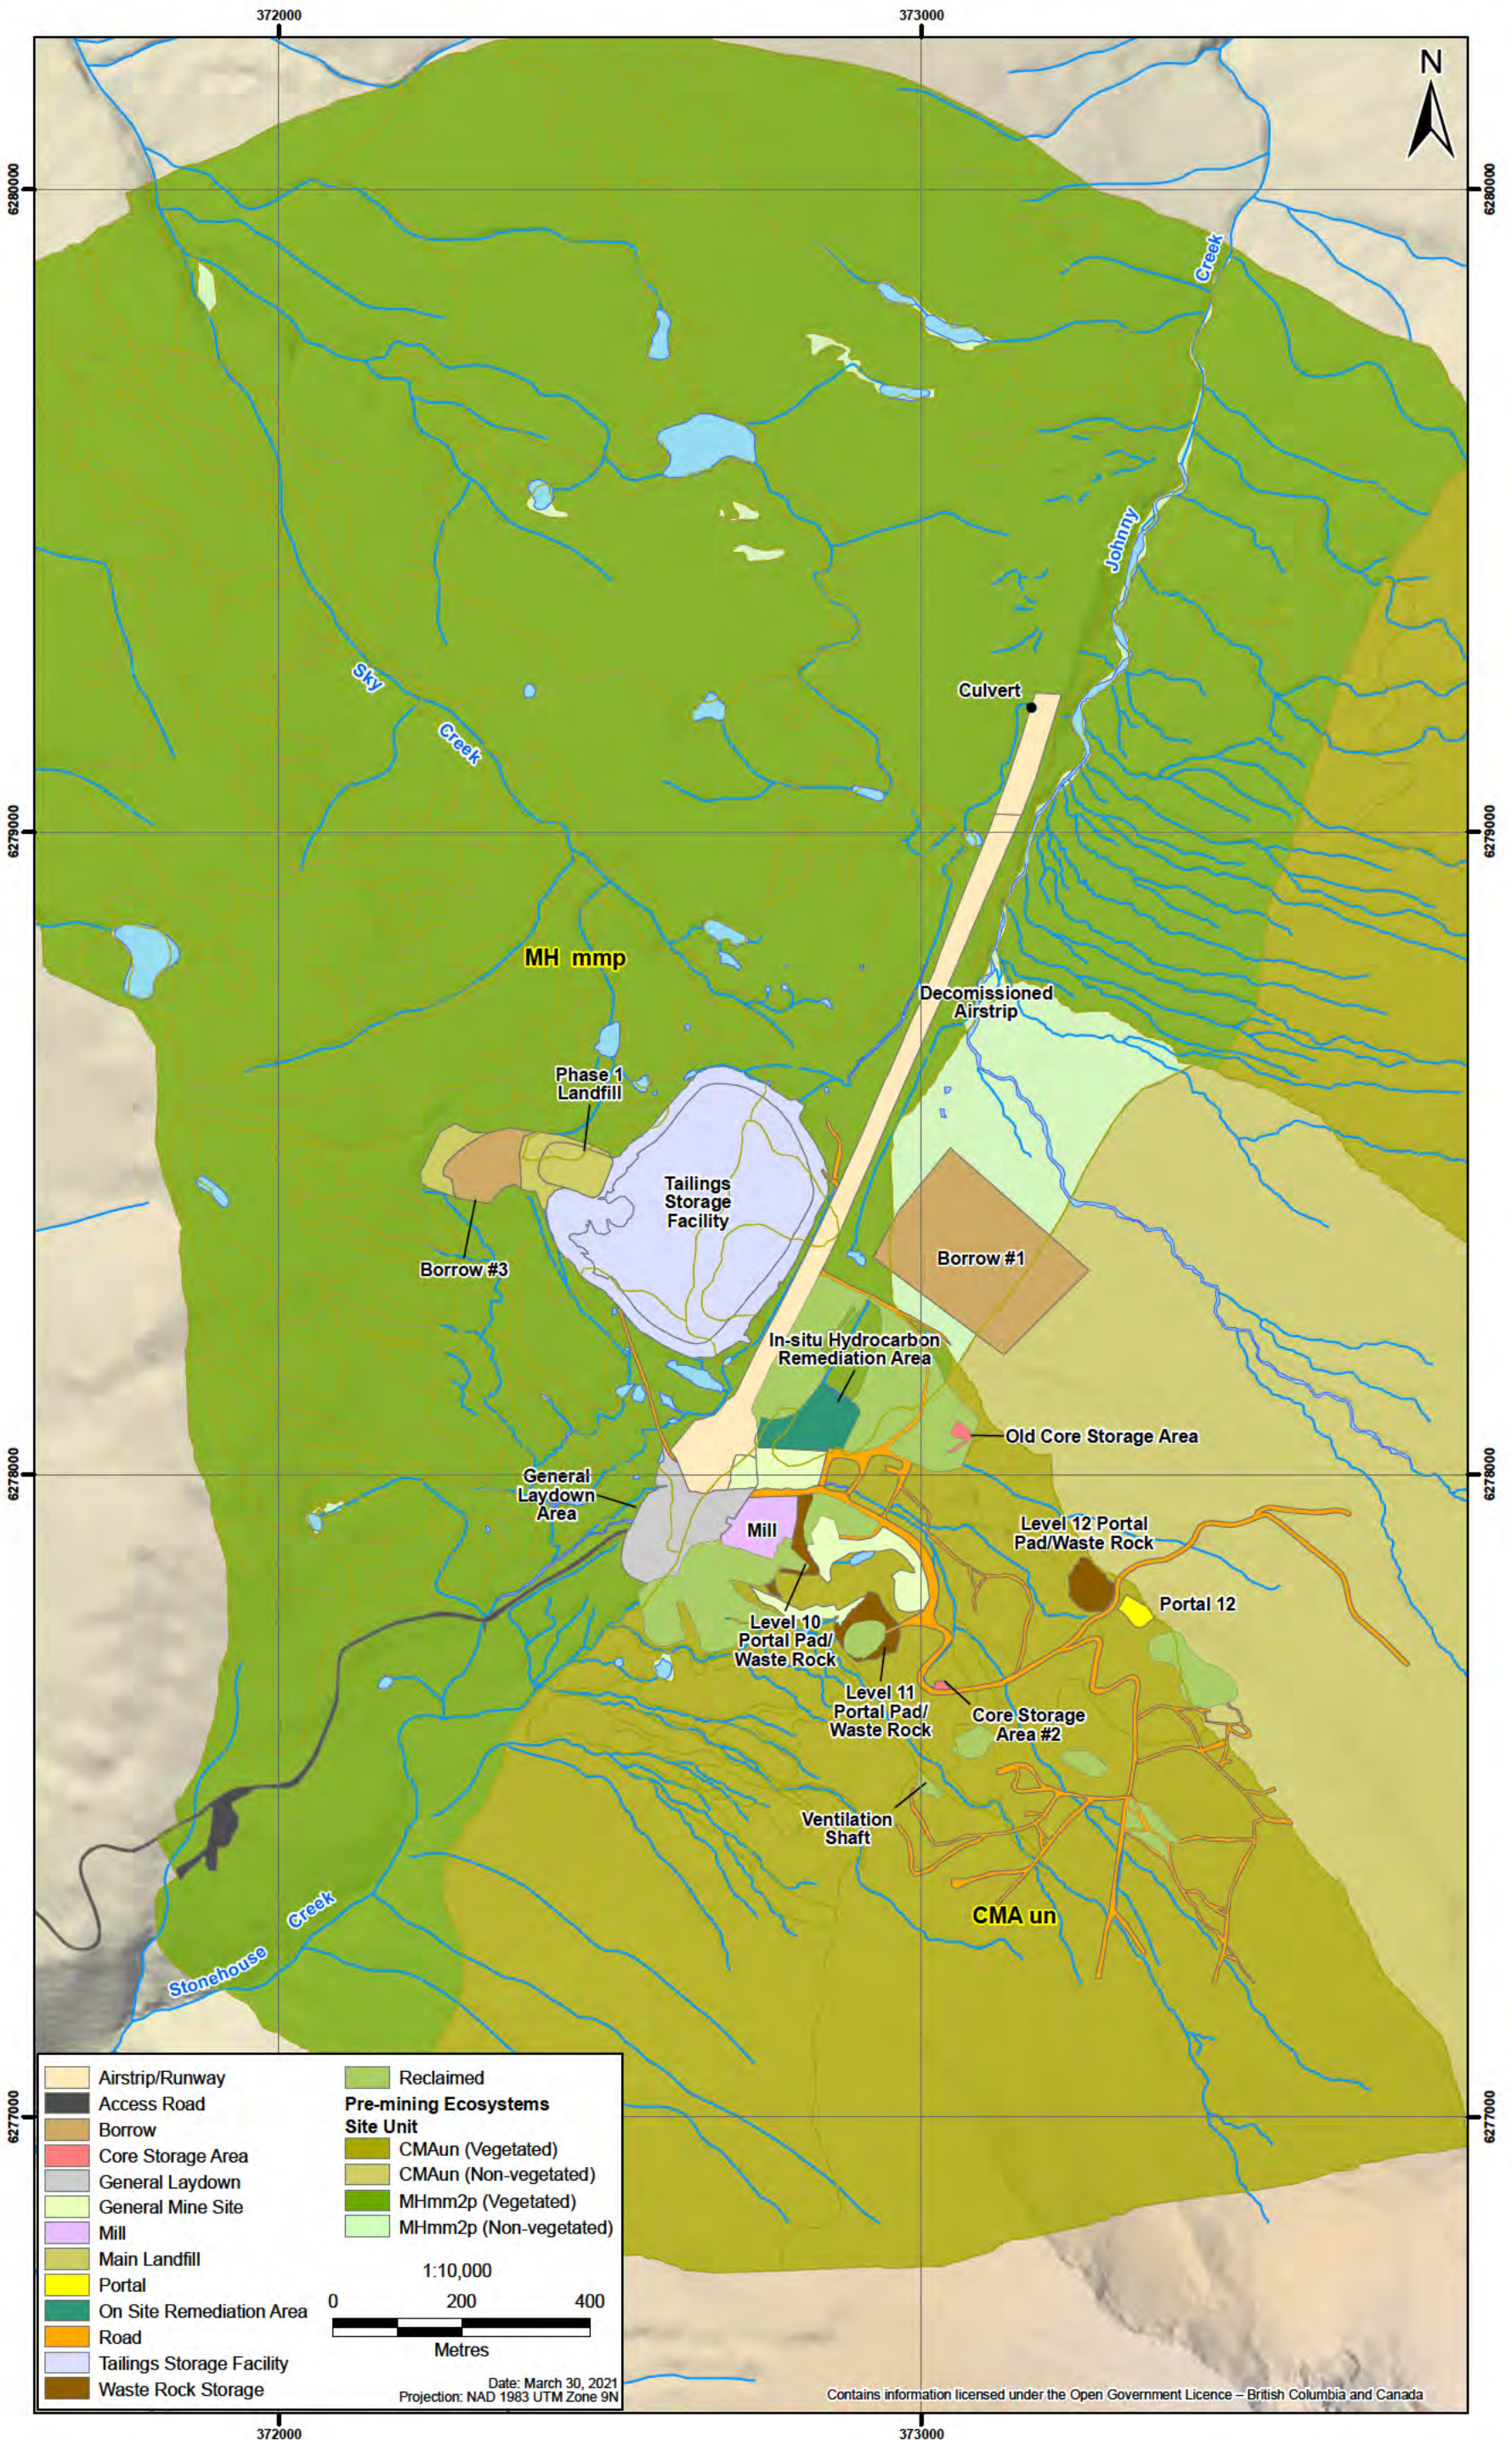

The five vent raises and three portals have all been closed, contributing to the long-term stability of the land and watercourses on site.

#### 4.1.4 Revegetation

The vegetation condition specified in Permit M-178 is as follows: *On all lands suitable, as designated by the Chief Inspector, the land shall be re-vegetated to a self-sustaining state using appropriate plant species.*

Figure 4.1-1

Terrestrial Ecosystem Mapping of the Johnny Mountain and Adjacent Areas

In July 2019, a set of revegetation trials was established at the north end of the decommissioned airstrip. The northern end of the airstrip was selected to conduct the reclamation trials because it is relatively isolated from the historical mine area and is unlikely to be disturbed by other reclamation activities. The airstrip is also the largest single feature that will be reclaimed at 5.26 ha.

The objective of the trials was to evaluate potential revegetation methods for the site that achieve the closure and reclamation goals, specifically of revegetating disturbed lands through the development of self-sustaining natural successional processes, and to produce vegetative cover that provides stable and productive wildlife habitat (RTEC 2021f). The trial methods were designed to provide some grass cover while allowing natural ingress and establishment of other native plant species. Based on estimates in the field at the time of the revegetation trials, the soil in the trial area is a silty loam with 60 to 70% CFC and has less than 1% organic matter content (RTEC 2019b).

In the revegetation trials, four treatment plots were established that included seeding native grasses at four different rates and transplanting plugs of alpine vegetation. Monitoring surveys were conducted on July 9, 2020 and September 7, 2020. In July 2020, four 5.64 m radius circular plots were established in each of the four treatment plots. Within these plots, a smaller, 2 m radius plot was established, and three 1 m<sup>2</sup> subplots were randomly identified for survey.

During the July 2020 survey, the following variables were measured in each of the four treatments:

- In 2 m radius plots, stem counts of:
  - shrubs, and
  - herbs.
- In 2 m radius plots and 1 m<sup>2</sup> subplots, percent cover of:
  - shrubs,
  - herbs,
  - grass, and
  - lichen and moss.
- In 5.64 m radius plots, percent survival of transplanted plugs of native plants.

In addition to the quantitative measurements above, photos were taken to document the vegetation in the 1 m<sup>2</sup> subplots and in each of the four cardinal directions for the 5.64 m radius plots.

During the September 2020 monitoring survey, photos were repeated in the 5.64 m radius plots in each of the four cardinal directions.

The vegetation was relatively immature during the first survey period in July. Plants in the trial plots were at early stages of development. Surveyors were unable to consistently identify plants to the species level, but were able to assess vegetation cover by type, and overall survival of transplanted vegetation plugs within the plots sampled. A second set of photos was collected in September to document vegetation establishment and growth later in the season. A detailed report including the Johnny Mountain Vegetation Monitoring Protocol, Raw data for stem counts and percent cover is found in Appendix K (Johnny Mountain Mine Revegetation Monitoring 2020).

Plugs were assessed within four 5.64 m radius plots in Treatment 1, the only treatment that had plugs installed in 2019. Plugs were counted as live if even a portion of the plug was living and percent of the

plug alive was recorded. Of the 103 total plugs observed in the plots sampled, 95% were alive and only five of the live plugs had less than 50% live vegetation in July 2020 (Photo 4.1-1). Planting conditions in 2019 were hot and dry and not optimal. However, overall survival of the plugs after the first year was high.

Photo 4.1-1: Plugs in Treatment 1 (seeding = 5 kg/ha, planting = 2,253 plants/ha). A) A Successfully transplanted live plug with high survival, July 2020. B) Plug with less than 50% survival, July 2020.

#### 4.1.5 Growth Medium

The Growth Medium condition specified in Permit M-178 is as follows: a) On all lands to be *re-vegetated*, the growth medium shall satisfy land use, capability, and water quality objectives; b) All severely compacted areas shall be deeply ripped prior to placement of growth media and/or vegetation.

In-situ hydrocarbon remediation has been undertaken since 2018 in the In-situ Hydrocarbon Remediation Area (Appendix J; Wood 2021a), which aims to modify hydrocarbon contaminated soil on site towards appropriate standards for use in reclamation activities. In 2020 the scope of work included the completion of year-end sampling of Treatment Area 1 and Treatment Area 2. The results of the 2020 sampling are described in Section 3.1.9.2, and indicate continued improvement in soil quality.

#### 4.1.6 Landforms

The landforms condition specified in Permit M-178 is as follows: *where practicable, land and watercourses shall be reclaimed in a manner that is consistent with the adjacent landforms.*

#### 4.1.7 Structures and Equipment

The Structures and Equipment condition specified in Permit M-178 is as follows: *a) prior to abandonment, and unless the Chief Inspector has made a ruling with respect to heritage project status or industrial*

use, i) all machinery, equipment and building superstructures shall be removed; ii) concrete foundations shall be covered and re-vegetated, unless because of impracticality, they have been exempted by an Inspector, and iii) all scrap material shall be disposed of in a manner acceptable to the district Inspector of Mines, Engineer.

#### 4.1.7.1 Mill Building

No Mill Building decommissioning activities were performed. Completion of Mill Building demolition and Site grading is planned for 2023 (Appendix C Project Execution Plan).

#### 4.1.7.2 Main Landfill

No Main Landfill upgrades or waste filling activities took place during 2020.

#### 4.1.7.3 Onsite Equipment Repairs in 2020

The onsite equipment is critical to the Johnny Mountain Mine reclamation/closure plan and ongoing repairs are necessary when heavy equipment are available. Heavy equipment was not available for the 2020 field season.

#### 4.1.8 Watercourse Reclamation

The watercourses condition specified in Permit M-178 is as follows: *Watercourses shall be reclaimed to a condition that ensures a) Drainage is restored either to original watercourses or to new watercourses which will sustain themselves without maintenance, and b) The level of productive capacity shall not be less than existed prior to mining, unless the Permittee can provide evidence, which demonstrates, to the satisfaction of the Chief Inspector, that impracticality of doing so.*

The local drainages can be seen on the local site map in Figure 3.1-1. There was no reclamation work for watercourses on site in 2020.

#### 4.1.9 Waste Dump Reclamation

The dump condition specified in Permit M-178 is as follows: *Dumps shall be reclaimed to ensure a) long-term stability, and b) long-term erosion control.*

There are no waste rock dumps at JMM Site. However, there are three underground portals that were built up with waste rock to enable access to these sites. Each portal pad was found to contain a combination of non-acid generating and potentially acid generating materials, and segregation is not practical. In addition to placement of waste rock at the three portals, waste rock was used in the construction of on site roads, the decommissioned airstrip and the general laydown area (Price and Yeager 2004).

No waste rock was relocated in 2020. The relocation of waste rock material will continue to be included in the reclamation planning as documented in the 2021 Project Execution Plan (Appendix C).

#### 4.1.10 Open Pit Reclamation

There are no open pits at the Johnny Mountain Mine.

#### 4.1.11 Tailings Storage Facility Reclamation

The TSF condition specified in Permit M-178 is as follows: *Impoundment facilities shall be inspected, monitored and maintained to ensure stability.*

The TSF continued to operate passively in 2020 as intended. As per Permit M-178 conditions, a Dam Safety Inspection was carried out in August 2020 (Appendix H; KCB 2021). Refer to Section 3.1.6 for more details.

#### 4.1.12 Road Reclamation

The Roads condition specified in Permit M-178 is as follows: *a) All roads shall be reclaimed in accordance with land use objectives unless permanent access is required. This shall include the ripping of the road surface and re-contouring the roadway into adjacent landforms to reconstruct the areas' relative original landscape and moisture regime. b) Soil cover shall be replaced over the re-contoured surface and immediately re-vegetated with appropriate species that will lead to achieving end land use and productivity objectives. c) Included under this permit are all mine roads, the airstrip, and the 10 km Johnny Mountain Access Road.*

The Johnny Mountain access road from the Bronson airstrip is required to enable ongoing reclamation and exploration activities, therefore efforts will continue to maintain this road and not decommission it.

In 2017, LiDAR data was obtained and this information was used to evaluate the area of historical exploration trails that have been overgrown and vegetated naturally overtime through disuse. Table 2.5-1 (i.e., Standard Table 1 (Summary of Areas Disturbed and Reclaimed) EMLI ARR requirements (January 2021); see Section 2.5-1) captures the surface area for both these historical unused exploration trails and local site roads that remain active. Roads around the remaining infrastructure that will be needed until the completion of the on-going reclamation activities will remain active.

No road reclamation activities took place in 2020 at the JMM site.

#### 4.1.13 Infrastructure Decommissioning/Reclamation

There is no specific condition in Permit M-178 relating to Infrastructure Decommissioning/Reclamation.

No activities took place in 2020 for decommissioning infrastructure on site.

#### 4.1.14 Securing Openings

The Secure Openings condition specified in Permit M-178 is as follows: *a) All access roads shall be effectively blocked to prevent inadvertent vehicular access to surface areas of the mine that may be dangerous. b) All shafts, raises, stope openings, adits, or drifts opening to the surface shall either be capped with reinforced concrete or filled with material so that subsidence of the material will not pose a future hazard. c) In the case of shafts or raises, the cap shall be secured to solid rock, or to a concrete collar secured to solid rock, and capable of supporting a uniformly distributed load of 12 kPa or a concentrated load of 24 kN, whichever is greater. d) Where there is evidence or a potential for use by wildlife, mine openings may be fitted with a barrier that allows wildlife passage but prevents human entry. e) When mine openings are permanently closed and it may be possible for mine water to build to dangerous pressures, a permanent drain shall be installed.*

No additional reclamation activities to secure openings were necessary in 2020.

#### 4.1.15 *Disposal of Hazardous Materials, Chemicals, and Reagents*

The Disposal of Fuels and Toxic Chemicals condition specified in Permit M-178 is as follows: *Fuels, chemicals or reagents, which cannot be returned to the manufacture/supplier, are to be disposed of as directed by the Chief Inspector in compliance with municipal, regional, provincial and federal statutes.*

The scope of work for the Hydrocarbon Remediation Area was limited to end-of-year sampling in Treatment Area 1 and Treatment Area 2; see Section 3.1.9 for more details.

#### 4.1.16 *Reclamation Research*

Vegetation trials were initiated in 2019. The scope of work for 2020 included trials to evaluate the revegetation methods, and are described in Section 4.1.4. Refer to Appendix K for further details of the trials.

### 4.2 Next Year: 2021 Reclamation Program

The following text provides an overview of the planned 2021 reclamation activities as described in the 2021 Project Execution Plan (Appendix C; SnipGold 2021). The primary goal of the 2021 season is the excavation and relocation of PAG waste rock from the Level 10, 11, 12 portals, as well as isolated pockets of PAG waste rock located on the JMM airstrip and secondary access roads. All excavated waste rock will be mixed with hydrated lime to add neutralization potential and prevent the release of dissolved metals as the waste rock is placed below water cover inside the TSF.

The objective in 2021 is to show tangible progress, working toward completing the JMM reclamation project within the established budget and timeline, highlighting value to SnipGold stakeholders.

#### 2021 Planned Reclamation Related Activities:

- Ensure No Harm to Personnel or Environment by maintaining a controlled, safe and secure site. Safety and Safe work practices are of paramount importance to SnipGold.
- Ongoing environmental monitoring. A key component of the JMM Reclamation Program is to show continued improvement to the JMM site as the reclamation program moves toward returning the site to its natural state as per permit PE-8415 and M-178.
- In-situ Soil Remediation - An estimated soil volume of 9,000 m<sup>3</sup> was treated within the JMM tank farm area during the 2018 and 2019 seasons. 2021 will continue with treatment of contaminated soils within the historic JMM tank farm and a portion of the JMM airstrip. Fertilizer and a natural biocatalyst (oil Gator) will be added to the soils and turned several times during the 2021 season to speed aeration and the treatment process.
- Excavation and Relocation of PAG waste rock - A significant scope of the JMM reclamation plan is the relocation of waste rock generated during the mine operation. The waste rock will be relocated from the portal location into the TSF. Hydrated lime will be added to the waste rock prior to being placed in the TSF to add neutralization potential and prevent the release of dissolved metals.
- Disposal of Mining Equipment - All miscellaneous site equipment will be disposed into the expanded JMM landfill (grader, crane, D6 dozer and snow cat). The old mining equipment has been deemed unsalvageable by Finning and Matrix mechanics and will be cut down and placed into the JMM landfill. All fluids will be drained from equipment prior to disposal and transported off site and disposed in an approved disposal facility.

- Complete minor upgrades to JMM access road. The JMM access road will require upgrades early in the 2021 season. This will involve ditching, brushing, culvert installation and upgrades where wash outs occurred late in the 2019 season.
- Conduct annual Dam Safety Inspection (DSI). Klohn Crippen Berger (KCB) is the Engineer of Record and will conduct the yearly DSI of the JMM TSF. Data will be downloaded from the TSF vibrating wire piezometers to support the DSI. A Dam Safety Review is required every 5 years, and it will be carried out in 2021.
- Test pits and material testing. Conduct additional test pits and material testing to prove borrow source material on site.
- Equipment Repairs and upgrades. Complete ongoing repairs and upgrades to site equipment to ensure minimal delays due to breakdowns. Repairs to DJB Rock Truck, CAT 235 excavator, Kenworth dump truck, CAT 966 Loader.

Additional opportunities to complete reclamation activities may arise through 2021. Should this occur, activities will be reported in the 2021 Annual Reclamation Report.

#### 4.3 Next Five Years: Planned 2021-2025 Activities

SnipGold will continue to execute the JMM Closure Plan objectives and actions in order to achieve the overall land use objective of returning disturbed lands and new anthropogenic landforms to alpine tundra wildlife habitat.

Some of the tasks scheduled for the next five years include:

- completion of ML/ARD waste relocation from portals #10, 11, 12, and isolated pockets from the decommissioned airstrip and secondary roads to the TSF, placed below water cover;
- TSF downstream embankment modifications for final closure;
- continued dam safety inspections;
- annual environmental monitoring (water quality, hydrology, weather station, weirs and groundwater wells);
- complete Mill building demolition and site grading;
- final upgrades and closure of JMM landfill;
- decommission all exploration roads on JMM Site;
- site auction or transport off site of all mobile stock; and
- vegetation planting (Appendix C Project Execution Plan).

Complete reclamation and closure of the JMM Site is anticipated within the next few years. This will be achieved through sequenced decommissioning of remaining on site infrastructure (e.g., conveyor and Mill Building demolition), and site grading, removal of waste materials from the surface of the site and subsequent re-vegetation of target areas as identified in Section 4.1.2 above.

The Main Landfill will be used to dispose of all inert authorized waste types generated on site. Phase 2 expansion of the Main Landfill will occur should SnipGold need additional capacity beyond the 38,000 m<sup>3</sup> of Phase 1's Cell 1 and 2. Hazardous wastes will continue to be disposed of at appropriately authorized facilities off site.

SnipGold have a planned program to excavate, treat with hydrated lime and remove the waste rock pads remaining on the surface of the JMM Site to the TSF. As per Permit M-178, all waste rock will be submerged in the TSF. Additionally, once it is safe to do so, the remaining ore concentrate in the Mill Building will be collected and disposed of in the TSF.

In-situ remediation of hydrocarbon contaminated soils will continue to encourage aeration and treatment of soils. The water management and drainage system associated with the In-situ Hydrocarbon Remediation Area where the treatment is occurring will be maintained, as required.

SnipGold will continue to conduct the necessary environmental programs and compliance monitoring associated with the JMM Site throughout the closure phase. As per the *Mines Act* and EMA permits requirements, compliance reports will be submitted to the relevant regulatory bodies annually.

## 5. OUTSTANDING RECLAMATION LIABILITY

Due to the COVID-19 pandemic, activities during the 2020 season were limited to permit compliance and environmental monitoring. The total expenditures in 2020 were [REDACTED]. The net outstanding reclamation liability estimate is [REDACTED]. This is based on the 2018 estimate (prepared to an AACE Class 2 Construction Cost Estimate level, with an expected accuracy range of 10%/+20%).

The scope of this estimate includes costs for the following areas where activities were carried out in 2020:

- o Code: 2100. Waste dumps (waste rock). Environmental sampling and planning. The estimated expenditures in 2020 were [REDACTED].
- o Code: 2200. Landfills/In-situ hydrocarbon remediation. In-situ hydrocarbon remediation continued in 2020. The estimated expenditures in 2020 were: [REDACTED].
- o Code 9100. Engineering and Technical Services. In 2020 tasks included the Dam Safety Inspection (M-178) and Inspection of erosion prevention and sediment control measures (PR-7927). The estimated expenditures for 2020 were: [REDACTED].
- o Code 9400. Construction Support. Temporary Construction Maintenance estimated expenditures were [REDACTED].
- o Code 9700. Health, Safety, Security and Environment, including safety supplies and training estimated expenditures were [REDACTED].
- o Code 9800. Temporary Camp and Catering costs. The estimated expenditures in 2020 were: [REDACTED].
- o Code 9900. Freight and Logistics/Contractor Support. This included freight shipping, transport shuttle and helicopter support for 2020. Estimated expenditures were: [REDACTED].
- o SnipGold Corp. internal Salaries were: [REDACTED].

Ongoing monitoring costs for 2020 are provided in Table 5-2.

Table 5-1: 2020 Reclamation Costing Estimate for Johnny Mountain Mine

Code	WBS #	Description	Detail	2017 Closure Cost Estimate	2018 Closure Cost Expenditures	2019 Closure Cost Expenditures	2020 Closure Cost Expenditures
2017 Cost Estimate	1100	Mine Adits	10 Level, 11 Level, 12 Level Adits	██████████	-	-	-
	1200	Vent Raises	Vent raises 11-17-76, 11-29B Stope, 11-28-66, 12-06-05, 12-13-03	██████████	██████████	-	-

APPENDIX A            JOHNNY MOUNTAIN MINE PROVINCIAL PERMITS

April 17, 2019

Tracking Number: 379083  
Authorization Number: 7927

**REGISTERED MAIL**

SNIPGOLD CORP.  
10TH FLOOR, 595 HOWE STREET  
VANCOUVER, BC, V6C 2T5

Dear Permittee:

Enclosed is amended permit PR-7927 issued under the provisions of the *Environmental Management Act*. Your attention is respectfully directed to the terms and conditions outlined in the permit. An annual fee will be determined according to the Permit Fees Regulation.

This permit does not authorize entry upon, crossing over, or use for any purpose of private or Crown lands or works, unless and except as authorized by the owner of such lands or works. The responsibility for obtaining such authority rests with the permittee. This permit is issued pursuant to the provisions of the *Environmental Management Act* to ensure compliance with Section 120(3) of that statute, which makes it an offence to discharge waste, from a prescribed industry or activity, without proper authorization. It is also the responsibility of the permittee to ensure that all activities conducted under this authorization are carried out with regard to the rights of third parties, and comply with other applicable legislation that may be in force.

This decision may be appealed to the Environmental Appeal Board in accordance with Part 8 of the *Environmental Management Act*. An appeal must be delivered within 30 days from the date that notice of this decision is given. For further information, please contact the Environmental Appeal Board at (250) 387-3464.

Administration of this permit will be carried out by staff from the Environmental Protection Division's Regional Operations Branch. Plans, data and reports pertinent to the permit are to be submitted by email or electronic transfer to the director, designated officer, or as further instructed.

Yours truly,

Mark P. Love P.Ag.  
for Director, *Environmental Management Act*  
Authorizations - North Region

Enclosure

MINISTRY OF  
ENVIRONMENT AND  
CLIMATE CHANGE  
STRATEGY

PERMIT

7927

*Under the Provisions of the Environmental Management Act*

**SNIPGOLD CORP.**  
**10TH FLOOR, 595 HOWE STREET**  
**VANCOUVER BC V6C 2T5**

is authorized to discharge refuse to the land and emissions to the air from open burning and incineration from a non-operating Johnny Mountain gold mine, mill and camp, located 90 kilometres northwest of Stewart, British Columbia, subject to the requirements listed below.

Contravention of any of these requirements is a violation of the *Environmental Management Act* and may lead to prosecution.

This authorization supersedes and replaces all previous versions of permit PR-7927 issued under sections 14 or 16 of the *Environmental Management Act*.

Where this authorization provides that the director may require an action to be carried out, the permittee must carry out the action in accordance with the requirements of the director.

**1. AUTHORIZED DISCHARGES**

**1.1 Inert Solid Waste Disposal**

This section applies to the discharge of refuse from a non-operating gold mine, mill and camp. The site reference number for this discharge is E236686.

1.1.1 The maximum authorized volume of solid waste that can be discharged is 38,000 m<sup>3</sup>.

1.1.2 The authorized discharge period is continuous between the years 2018 to

Date issued: March 22, 1989  
Date amended: April 17, 2019  
(most recent)

  
Mark P. Love P.Ag.  
for Director, *Environmental Management Act*  
Authorizations - North Region

2022 snow-free seasons.

1.1.3 The Authorized Works are the Main Landfill.

1.1.4 The permittee must not discharge under this authorization unless the Authorized Works are complete and fully operational.

1.1.5 The location of the facilities from which the discharge is authorized to originate is the non-operating Johnny Mountain Mine. The point of discharge is the Main Landfill located at latitude 56° 04' 28" and longitude 131° 37' 57".

1.2 **Emissions from Regulated Open Burning of Wood Waste and Associated Products**

This subsection applies to the discharge of contaminants to the air from the open burning of wood waste and associated products from the demolition and reclamation of the Johnny Mountain Mine site, mill.

1.2.1 The maximum authorized rate of discharge is indeterminate.

1.2.2 The characteristics of the emissions must be typical of those originating from the regulated open burning of wood waste, cardboard, paper and paper products.

1.2.3 The location of the facilities from which the discharge is authorized to originate and the point where the discharge is authorized to occur is the same as specified in subsection 1.1.5 above.

2. **GENERAL REQUIREMENTS**

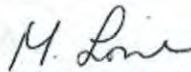

2.1 **Auxiliary Fueled, Forced Air Incineration**

Authorization for the discharge of emissions from a properly designed auxiliary fired refuse incinerator that serves a remote industrial camp with a design capacity of less than 100 persons is through the Waste Discharge Regulation pursuant to the *Environmental Management Act*.

2.2 **Nature of Open Burn Waste**

The permittee must not open burn waste which is unacceptable to the director.

Date issued: March 22, 1989  
Date amended: April 17, 2019  
(most recent)

  
Mark P. Love P.Ag.  
for Director, *Environmental Management Act*  
Authorizations - North Region

Unacceptable materials include nuisance causing combustibles such as painted and treated wood, rubber, plastics, tars, asphalt shingles, roofing material, insulation, etc.

Acceptable materials include unpainted, untreated demolition and construction wood wastes, broken lumber and pallets, slabs, log ends and branches, brush and miscellaneous, non-recyclable cardboard and paper products.

### 2.3 **Combustion Residue Disposal**

The permittee must incorporate the residue of combustion from a burn into the landfill authorized in subsection 1.1 or a landfill authorized by the director once such residue has cooled to ambient temperature.

### 2.4 **Licence to Publish Documents**

- a. Subject to paragraph b, the permittee authorizes the Province to publish on the Ministry of Environment and Climate Change Strategy website the entirety of any Regulatory Document.
- b. The Province will not publish any information that could not, if it were subject to a request under section 5 of the *Freedom of Information and Protection of Privacy Act*, be disclosed under that Act.
- c. The permittee will indemnify and save harmless the Province and the Province's employees and agents from any claim for infringement of copyright or other intellectual property rights that the Province or any of the Province's employees or agents may sustain, incur, suffer or be put to at any time that arise from the publication of a Regulatory Document.

### 2.5 **Maintenance of Works and Emergency Procedures**

#### 2.5.1 **Maintenance of Works**

The permittee must regularly inspect the Authorized Works and maintain them in good working order. If components of the Authorized Works have a manufacturer's recommended maintenance schedule, then those components must, at a minimum, be maintained in accordance with that schedule.

The permittee must maintain a record of inspections and maintenance of the Authorized Works, and make the record available to an officer upon request.

Date issued: March 22, 1989  
Date amended: April 17, 2019  
(most recent)

  
Mark P. Love P.Ag.  
for Director, *Environmental Management Act*  
Authorizations - North Region

### 2.5.2 Emergency Procedures

In the event of an emergency or other condition which prevents normal operation of the Authorized Works or leads to an unauthorized discharge, the permittee must take remedial action immediately to restore the normal operation of the Authorized Works and to prevent any unauthorized discharges. The permittee must immediately report the emergency or other condition and the remedial action that has and will be taken to the [EnvironmentalCompliance@gov.bc.ca](mailto:EnvironmentalCompliance@gov.bc.ca) email address or as otherwise instructed by the director.

### 2.6 Use of Qualified Professional(s)

The permittee must cause a Qualified Professional to

- a. Certify all facilities and information, including works, plans, assessments, investigations, surveys, programs and reports related to the design, and
- b. Seal all as-built drawings.

### 2.7 Landfill Operation

The permittee must compact all refuse and confine such compacted refuse to the smallest practical area and volume at the operating face of the landfill. The permittee must apply a minimum 0.15 metre of cover material that is to the satisfaction of the director, on all exposed solid waste at least once per month while in use. The director may vary the frequency of covering when freezing conditions adversely affect normal operation or when sufficient quantities of soil material are incorporated with the waste.

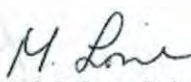

### 2.8 Litter Control

The permittee must use the best practical means available to prevent the scatter of litter at the site. The permittee must clean up any litter scattered at a minimum of twice per year.

### 2.9 Final Cover

The permittee must apply final cover to all areas of the site that have reached final landfill elevations as soon as practical thereafter. Final cover requirements must be in accordance with the approved 2018 Johnny Mountain Mine TAR Chapter 3.2 Facility Design, Operation, and Closure Plan.

Date issued: March 22, 1989  
Date amended: April 17, 2019  
(most recent)

  
Mark P. Love P.Ag.  
for Director, *Environmental Management Act*  
Authorizations - North Region

### 2.10 Wildlife Nuisance

The director may require the permittee to construct or modify works, or follow specific operating instructions, if the director is of the opinion that there is a possibility of a nuisance or hazard being caused by bears or other animals that are attracted to the site.

### 2.11 Water Table Restriction

The permittee must not deposit or store waste at the site at less than 1.22 metres above the highest groundwater level at the site.

### 2.12 Hazardous Waste Segregation

The permittee must comply with all applicable provisions of the Hazardous Waste Regulation of the *Environmental Management Act* when handling and disposing any hazardous waste generated during the mine reclamation. Hazardous waste as defined by the regulation is not authorized for discharge to the Main Landfill. Where conflict exists between this permit and the Hazardous Waste Regulation, the latter must take precedence.

### 2.13 Confirmatory Soil Testing

Following the excavation of Burial Sites #1 and #2, the permittee must complete confirmatory soil sampling and analysis from the walls and floors of the excavations to confirm removal of all waste material. The confirmatory testing must be completed in a matter consistent with the Technical Guidance 1 on Contaminated Sites, "Site Characterization and Confirmation Testing". Results and interpretations of the confirmatory soil testing must be submitted as part of the annual report required by section 3.

### 2.14 Erosion Prevention and Sediment Controls

At the start of the reclamation activities the permittee must develop, implement and then maintain erosion prevention and sediment control measures. Each snow-free season, until the end of the authorization provided in section 1.1, a Qualified Professional must assess whether those controls are being undertaken and are effective. That assessment, including recommended updates to the control measures, must be submitted as part of the annual report required by section 3.

(most recent)

  
Mark P. Love P.Ag.  
for Director, *Environmental Management Act*  
Authorizations - North Region

## 2.15 Main Landfill Water Monitoring

The permittee must annually monitor groundwater and surface water downslope from the Main Landfill for a period of five years, starting in summer 2018. The following table specifies the monitoring sites, frequency and parameters.

Table 1: Monitoring sites, frequency and parameters to be analyzed

Monitoring Sites	Location Description	Monitoring Period, Parameters and Frequencies	
		Water Quality	Water Level
MW17-22A (existing site)	Deep monitoring well downgradient from the Main Landfill.	A <sup>1</sup>	A
MW17-22B (existing site)	Shallow monitoring well downgradient from the Main Landfill.	A <sup>1</sup>	A
Sky Creek 1.0 (new site)	New surface water station on a tributary to Sky Creek, downslope from the Main Landfill and upstream from MW17-22.	A <sup>2</sup>	-

**Notes:**

**A** Annually (during summer)

**1** Field Parameters: specific conductivity, temperature, ORP, and pH.  
Analytical parameters: BTEX, EPH, PAH, dissolved metals, pH, alkalinity, bicarbonate, carbonate, chloride, conductivity (EC), fluoride, hardness, hydroxide, total iron, total magnesium, total manganese, nitrate, nitrite, ammonia, total potassium, total sodium, sulphate, TDS, TIC, TOC, COD and turbidity, acidity (hot peroxide titration) and cyanides (WAD, free, total, cyanate and thiocyanate).

**2** Field Parameters: specific conductivity, temperature and pH.

Analytical parameters: BTEX, EPH, PAH, total metals, pH, alkalinity, bicarbonate, carbonate, chloride, conductivity (EC), fluoride, hardness, nitrate, nitrite, ammonia, sulphate, TDS, TIC, TOC, COD and turbidity, acidity (hot peroxide titration) and cyanides (WAD, free, total, cyanate and thiocyanate).

Results and interpretations of the water monitoring program specified above must be submitted as part of the annual report required by section 3.

Date issued: March 22, 1989

Date amended: April 17, 2019  
(most recent)

  
Mark P. Love P.Ag.  
for Director, *Environmental Management Act*  
Authorizations - North Region

### 3. ANNUAL REPORTING

The permittee must, on or before each March 31 that occurs during the term of this Authorization, submit such data, operating and discharge periods for the preceding calendar year to the director, by email at [EnvAuthorisationsReporting@gov.bc.ca](mailto:EnvAuthorisationsReporting@gov.bc.ca) or as otherwise instructed by the director, in a form that is tabulated, graphically represented and interpreted to the satisfaction of the director. For guidelines on how to properly name the files and email subject lines or for more information visit the Ministry website: <https://www2.gov.bc.ca/gov/content/environment/waste-management/waste-discharge-authorization/data-and-report-submissions/routine-environmental-reporting-submission-mailbox>

The annual report must include:

- a. A summary of spills and other environmental incidents;
- b. All environmental monitoring data collected during the demolition, waste excavation and associated disposal activities;
- c. Description and volume of waste materials excavated from Burial Sites #1 and #2;
- d. Description and volume of demolition waste;
- e. Characterization of suspected hazardous waste materials and its disposal method, as required by section 2.12;
- f. Results of confirmatory soil testing, as required by section 2.13;
- g. Assessment of sediment control measures, as required by section 2.14;
- h. A summary of all surface water and groundwater quality, and groundwater levels, including from previous years, suitably tabulated and graphed, where appropriate, to indicate key water quality trends, as required by section 2.15;
- i. Assessment of quality control/quality assurance data; and
- j. Site management and monitoring recommendations related to the mine reclamation.

The format of the annual report must be suitable for review by the public and copies must be made available to the Ministry of Energy, Mines and Petroleum Resources and the Tahltan First Nation.

### 4. NON-COMPLIANCE REPORTING

#### 4.1 Non-compliance Notification

The permittee must immediately notify the director or designate by email at [EnvironmentalCompliance@gov.bc.ca](mailto:EnvironmentalCompliance@gov.bc.ca), or as otherwise instructed by the

Date issued: March 22, 1989  
Date amended: April 17, 2019  
(most recent)

  
Mark P. Love P.Ag.  
for Director, *Environmental Management Act*  
Authorizations - North Region

director of any non-compliance with the requirements of this Authorization by the permittee and take remedial action to remedy any effects of such non-compliance.

The permittee must provide the director with written confirmation of all such non-compliance events, including available test results within 24 hours of the original notification by email at [EnvironmentalCompliance@gov.bc.ca](mailto:EnvironmentalCompliance@gov.bc.ca), or as otherwise instructed by the director.

#### 4.2 **Non-compliance Reporting**

If the permittee fails to comply with any of the requirements of this Authorization, the permittee must, within 30 days of such non-compliance, submit to the director a written report that is satisfactory to the director and includes, but is not necessarily limited to, the following:

- a. All relevant test results obtained by the permittee related to the non-compliance,
- b. An explanation of the most probable cause(s) of the non-compliance, and
- c. A description of remedial action planned and/or taken by the permittee to prevent similar non-compliance(s) in the future.

The permittee must submit all non-compliance reporting required to be submitted under this section by email to the Ministry's Compliance Reporting Submission Mailbox (CRSM) at [EnvironmentalCompliance@gov.bc.ca](mailto:EnvironmentalCompliance@gov.bc.ca) or as otherwise instructed by the director. For guidelines on how to report a non-compliance or for more information visit the Ministry website:

<https://www2.gov.bc.ca/gov/content/environment/waste-management/waste-discharge-authorization/data-and-report-submissions/compliance-reporting-mailbox>

#### 5. **SPILL REPORTING**

The permittee must immediately report all spills to the environment (as defined in the Spill Reporting Regulation) in accordance with the Spill Reporting Regulation, which among other things, requires notification to Emergency Management BC at 1-800-663-3456.

Date issued: March 22, 1989  
Date amended: April 17, 2019  
(most recent)

  
Mark P. Love P.Ag.  
for Director, *Environmental Management Act*  
Authorizations - North Region

## 6. GLOSSARY

Capitalized terms referred to in this authorization are defined below. Other terms used in this authorization have the same meaning as those defined in the *Environmental Management Act* and applicable regulations.

### 6.1 "Authorized Works"

"Authorized Works" means Main Landfill as stated in subsection 1.1.3 and auxiliary fired refuse Incinerator as stated in subsection 2.1;

### 6.2 "Regulatory Document"

"Regulatory Document" means any document that the permittee is required to provide to the director or the Province pursuant to:

- i. This Authorization;
- ii. Any regulation made under the *Environmental Management Act* that regulates the facility described in this Authorization or the discharge of waste from that facility; or
- iii. Any order issued under the *Environmental Management Act* directed against the permittee that is related to the facility described in this Authorization or the discharge of waste from that facility;

### 6.3 "Qualified Professional"

"Qualified Professional" means an applied scientist or technologist specializing in an applied science or technology applicable to the duty or function, including, if applicable and without limiting this, agrology, biology, chemistry, engineering, geology or hydrogeology and who :

- i. Is registered with the appropriate professional organization, is acting under that organization's code of ethics and is subject to disciplinary action by that organization, and
- ii. Through suitable education, experience, accreditation and/or knowledge, may be reasonably relied on to provide advice within their area of expertise.

All documents submitted to the director by a Qualified Professional must be signed by the author(s).

Date issued: March 22, 1989

PROVINCE OF BRITISH COLUMBIA  
MINISTRY OF ENERGY AND MINES

**AMENDED PERMIT**

**APPROVING WORK SYSTEM AND RECLAMATION PROGRAM**

(Issued pursuant to Section of the **Mines Act** R.S.B.C. 1996, c. 293)

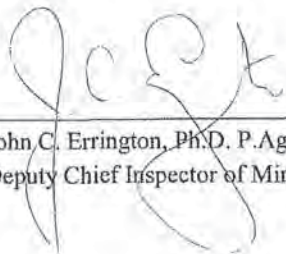

Permit: **M-178**

Issued to: **Skyline Gold Corporation**  
**1118 - 925 West Georgia Street**  
**Vancouver, British Columbia**  
**V6C 3L2**

for work located at the:

**Johnny Mountain Mine**

Amended at Victoria, British Columbia this 7th day of July in the year 2004.

---

John C. Errington, Ph.D. P.Ag.  
Deputy Chief Inspector of Mines

## PREAMBLE

An application describing plans for the protection and reclamation of the surface of the land and watercourses affected by the mine, entitled "Closure Plan for the Johnny Mountain Gold Mine, International Skyline Gold Corporation", dated October 13, 1999 was filed with the Chief Inspector of Mines (Chief Inspector) on October 21, 1999 in accordance with Part 10(6) of the **Mines Act**.

The following letter forms part of this application:

Letter by D. Yeager entitled "Aspects of ML/ARD in Closure Plan for the Johnny Mountain Mine Site" dated December 24, 2002.

This application was referred to other agencies in accordance with Part 10.3 of the Health, Safety and Reclamation Code for Mines in British Columbia (Code).

This permit contains the requirements of the Ministry of Energy and Mines (MEM) for reclamation. It also is compatible, to the extent possible, with the requirements of other provincial ministries for reclamation issues. The amount of security required by this permit and the manner to which this security may be applied, will also reflect the requirements of those ministries. However, nothing in this permit limits the authority of other provincial ministries to set other conditions, or to act independently, under their respective permits and legislation.

The reclamation liability to fully implement closure on this property has been estimated by MEM to be \$1,591,179.00 (One Million, Five Hundred and Ninety One Thousand, One Hundred and Seventy Nine Dollars). This estimated cost of reclamation liability includes:

- site decommissioning, including chemical and waste oil disposal
- disposal of PAG waste rock into a secure flooded location
- tailings relocation
- tailing impoundment stabilization
- sealing of portals and vent raises
- contaminated soil treatment
- removal of mill buildings and tank farm
- miscellaneous demolition and disposal of camp facilities, warehouses and offices
- construction of diversion ditches etc.
- estimate of demobilization costs
- site preparation and revegetation
- on-going site monitoring and maintenance requirement and,
- water quality sampling

## CONDITIONS

The Chief Inspector of Mines (herein called the Chief Inspector) hereby approves the amended programs for protection and reclamation of the land surface and watercourse affected by the mine reclamation plan subject to compliance with the following terms and conditions.

### General

1. Compliance with Mines Act and Code

All work shall be in compliance with all sections and parts of the **Mines Act** and Code and the owner, agent or manager (herein called the Permittee) shall obey all orders issued by the Chief Inspector or his delegate.

2. Departure from Approval

The Permittee shall notify the Chief Inspector in writing of any intention to depart from either the plan of the work system or the program for the protection and reclamation of the surface of the land and watercourses to any substantial degree, and shall not proceed to implement the proposed changes without the written authorization of the Chief Inspector.

3. Reporting

- (a) By March 31 of each year, an Annual Reclamation Report shall be submitted in a form and containing the information required by the Chief Inspector. The Annual Reclamation Report shall document the current status of the work system, reclamation obligations, the outstanding liability and associated costs, and all monitoring including water quality, and ongoing maintenance activities.
- (b) An update to the Closure Plan shall be submitted by **March 31, 2005** providing the current status of the work system and reclamation obligations, a compilation of all monitoring including ML/ARD prediction, water quality, closure and maintenance activities, any changes to the reclamation program that affect long-term mitigation, contingency plans, schedule for completion of reclamation works, and a breakdown of outstanding liabilities and associated costs.

- (c) By **March 31, 2005** the Permittee shall submit a Closure Management Manual which describes and documents key aspects of the operational surveillance and monitoring requirements used to track important changes which could affect long term mitigation performance, monitoring and maintenance requirements. This document shall be a living document that is kept up to date with updates submitted to this Ministry whenever significant changes occur.

#### **Health and Safety**

1. Operational Procedure for Waste Dumping into the Tailings Impoundment

The Permittee shall prepare and submit an operational procedure describing the methodology to be used for waste dumping into the tailings impoundment, including platform construction (if required), monitoring and operator training. This procedure shall be submitted to the district Inspector of Mines, Engineer for review and approval before dumping will be allowed to commence.

#### **Geotechnical**

1. Tailings Storage Facility

The Permittee shall submit a final closure design report for all aspects of the tailings storage facility and water management system on the property for review and approval. The report shall include a stability review of the dam final designs. The report shall be submitted by **September 30, 2004**.

2. Tailings Storage Facility As-built Report

The Permittee shall submit an as-built report for closure construction of the tailings storage facility and water management system no later than March 31st of the year following completion of construction.

3. Long-term Inspections and Reporting

- (a) The Permittee shall inspect the tailings impoundment at least once a year, with the results reported in the Annual Reclamation Report. Any changes shall be immediately reported to the district Inspector of Mines, Engineer and Geotechnical Inspector.
- (b) Every 2 years, a Dam Safety Inspection Report prepared by a professional engineer, shall be submitted to the Chief Inspector by March 31st of the year following inspection.

- (c) If the yearly field inspection (a) is not undertaken by the Permittee, then every year, a Dam Safety Inspection Report prepared by a professional engineer, shall be submitted to the Chief Inspector by March 31st of the year following inspection.
- (d) A Dam Safety Review, prepared by a professional engineer, shall be submitted to the Chief Inspector by **March 31, 2005**, and every 10 years thereafter.

### **Metal Leaching and Acid Rock Drainage (ML/ARD)**

#### 1. General

- (a) All materials with the potential to generate ML/ARD shall be placed in a manner that minimizes the production and release of metals and contaminants to levels that assure long-term protection of environmental quality.
- (b) All plans for the prediction, and if necessary, the prevention, mitigation and management of metal leaching and acid rock drainage shall be prepared in accordance with the *Guidelines for Metal Leaching and Acid Rock Drainage at Minesites in British Columbia*.

#### 2. Disposal of PAG Waste Material

- (a) The only approved disposal location for PAG waste material is in the flooded tailings impoundment. Upon completion, the Permittee shall ensure that all PAG waste rock and tailings placed in the tailings impoundment is covered by a minimum of one metre of water during periods of minimum water levels.
- (b) PAG waste is defined as waste material with a  $NPR_{(sobek)} < 2$  and/or has a weathering rinse pH  $< 6$  and/or has an acidic drainage pH  $< 5.5$  and/or is showing signs of visible limonite staining.
- (c) The Permittee shall monitor the rinse pH of all PAG waste rock being placed in the tailings impoundment. Where the rinse pH is less than 4.5, the Permittee shall add alkalinity at a rate of 75 g/tonnes of waste rock (i.e. 2 kg of lime per 25 tonnes of waste rock) during excavation and loading of the trucks. No lime is to be applied when the daily pH in the tailings impoundment exceeds 7.5.
- (d) The Permittee shall keep an inventory of the materials placed in the tailings impoundment including: volume and tonnes of material, deposition location within the impoundment, rinse pH values, lime addition and drainage monitoring data.

3. Drainage Monitoring

The Permittee shall implement a program to monitor and track changes to drainage chemistry from disturbed areas and waste materials. The program shall be capable of detecting significant metal leaching and provide early warning about the onset of ARD or increases in contaminant loadings. This program must specify the frequency, sampling type, location, parameters to be analysed, detection limits and QA/QC procedures and triggers for implementing additional mitigation works, and shall be submitted with the 2004 annual Reclamation Report due **March 31, 2005**, for approval by the Chief Inspector.

4. Drainage Management and Collection

- (a) The Permittee shall maintain a system of drainage diversion and collection ditches to minimize contaminate loadings for areas of disturbance or waste disposal.
- (b) The Permittee shall install weirs or other suitable flow measuring equipment at all water quality monitoring locations so that flows can be monitored when water quality monitoring is conducted.
- (c) In the event that the mine site drainage is not of acceptable discharge quality, the Permittee shall collect and treat, or otherwise mitigate drainage for as long as is necessary.

5. Contingency Plans

Pursuant to condition 4 above, the Permittee must develop contingency plans demonstrating how contaminant loadings will be reduced, and receiving environment reclamation objectives will be achieved, should the underground and/or tailings mitigation strategies fail to protect against the onset of ML/ARD. Contingency Plans shall be described in the updated Closure Plan due **March 31, 2005**.

6. Research - Field Test Cells

The Permittee shall provide an update on the existing field test cells and reinstate a plan to provide for future monitoring. Plans shall be described in the updated Closure Plan due **March 31, 2005**.

## Reclamation Program

### 1. Reclamation Security

- (a) The Permittee shall cause to be deposited with the Minister of Finance, within 30 days of receipt of this permit, additional security in the amount of Nine Thousand Six Hundred and Seventy Two dollars (\$9,672.00) bringing the total security for this permit to Five Hundred and Twenty-five Thousand dollars (\$525,000.00). The security will be held by the Minister of Finance for the proper performance of the approved program and all the conditions of this permit in a manner satisfactory to the Chief Inspector..
- (b) The Permittee shall conform to all Ministry of Sustainable Resource Management and Ministry of Water, Land air Protection approval, license and permit conditions, including the **Waste Management Act**, Contaminated Sites and Special Waste regulations as well as the **Wildlife Act** and **Land Act**. Should the Permittee not conform to these requirements, and then all or part of the security may be used to cover the costs of these requirements.
- (c) The Province holds a security interest as detailed in the Asset Security Agreement dated April 1, 2000. The Permittee must annually inspect the assets for appraisal purposes, and provide a report to the Province as to their condition including any related maintenance records and depreciation.
- (d) The Permittee must annually estimate the outstanding liability for unfulfilled or ongoing work system, protection of the land and watercourses, and reclamation obligations. The detailed costs shall include those for the monitoring, care and maintenance of geotechnical works, and required predictive testwork and mitigation for metal leaching and acid rock drainage (ML/ARD).
- (e) The amount of security will be adjusted for inflation where required. The first adjustment will be made when the cumulative inflation from January 2005 exceeds 10% based on each of the previous years annual increase in the British Columbia Consumer Price Index (B.C. CPI).

### 2. Land Use

The proposed end land use as alpine tundra wildlife habitat is approved.

3. Capability

Excluding the tailings pond area, the average land capability to be achieved on the remaining lands shall not be less than the average that existed prior to mining.

4. Long-term Stability

Land, watercourses and access roads shall be left in a manner that ensures long-term stability.

5. Re-vegetation

On all lands suitable, as designated by the Chief Inspector, the land shall be re-vegetated to a self-sustaining state using appropriate plant species.

6. Growth Medium

- (a) On all lands to be re-vegetated, the growth medium shall satisfy land use, capability, and water quality objectives.
- (b) All severely compacted areas shall be deeply ripped prior to placement of growth media and/or vegetation.

7. Landforms

Where practicable, land and watercourses shall be reclaimed in a manner that is consistent with the adjacent landforms.

8. Structures and Equipment

- (a) Prior to abandonment, and unless the Chief Inspector has made a ruling with respect to heritage project status or industrial use,
  - (i) All machinery, equipment and building superstructures shall be removed,
  - (ii) Concrete foundations shall be covered and re-vegetated, unless because of impracticality, they have been exempted by an Inspector, and
  - (iii) All scrap material shall be disposed of in a manner acceptable to the district Inspector of Mines, Engineer.

- (b) The Permittee is responsible for the following structures and equipment located at the Bronson airstrip:
- (i) 'cold storage' building,
  - (ii) two storage buildings adjacent to the 'cold storage' building ("horse barn" and "green house"),
  - (iii) shipping office building,
  - (iv) mechanics lunchroom cabin,
  - (v) two aircraft maintenance cabins,
  - (vi) two 1986 Chevrolet 1-ton dual flat deck 4x4 trucks, one in running condition and one for parts,
  - (vii) miscellaneous shelving, benches and storage cupboards in buildings, and
  - (viii) 70 ton 'Link-belt' crane.

9. Dumps

Dumps shall be reclaimed to ensure,

- (a) long-term stability, and
- (b) long-term erosion control.

10. Erosion Control

Reduction of erosion shall be achieved through development of maintenance-free vegetation covers and the development of self-sustaining, erosion-resistant watercourses.

11. Watercourses

Watercourses shall be reclaimed to a condition that ensures,

- (a) Drainage is restored either to original watercourses or to new watercourses which will sustain themselves without maintenance, and

- (b) The level of productive capacity shall not be less than existed prior to mining, unless the Permittee can provide evidence, which demonstrates, to the satisfaction of the Chief Inspector, the impracticality of doing so.

12. Impoundments

Impoundment facilities shall be inspected, monitored and maintained to ensure stability.

13. Roads

- (a) All roads shall be reclaimed in accordance with land use objectives unless permanent access is required. This shall include the ripping of the road surface and re-contouring the roadway into adjacent landforms to reconstruct the areas' relative original landscape and moisture regime.
- (b) Soil cover shall be replaced over the re-contoured surface and immediately revegetated with appropriate species that will lead to achieving end land use and productivity objectives.
- (c) Included under this permit are all mine roads, the airstrip and the 10 km Johnny Mountain Access Road.

14. Securing Openings

- (a) All access roads shall be effectively blocked to prevent inadvertent vehicular access to surface areas of the mine that may be dangerous.
- (b) All shafts, raises, stope openings, adits, or drifts opening to the surface shall either be capped with reinforced concrete or filled with material so that subsidence of the material will not pose a future hazard.
- (c) In the case of shafts or raises, the cap shall be secured to solid rock, or to a concrete collar secured to solid rock, and capable of supporting a uniformly distributed load of 12 Kpa or a concentrated load of 24 kn, whichever is greater.
- (d) Where there is evidence or a potential for use by wildlife, mine openings may be fitted with a barrier that allows wildlife passage but prevents human entry.
- (e) When mine openings are permanently closed and it may be possible for mine water to build to dangerous pressures, a permanent drain shall be installed.

15. Disposal of Fuels and Toxic Chemicals

Fuels, chemicals or reagents, which cannot be returned to the manufacturer/supplier, are to be disposed of as directed by the Chief Inspector in compliance with municipal, regional, provincial and federal statutes.

16. Monitoring

The Permittee shall undertake monitoring to demonstrate that reclamation and environmental protection objectives including land use, water quality and stability of structures are being achieved.

June 10, 2019

Tracking Number: 382371  
Authorization Number: 8415

**REGISTERED MAIL**

SNIPGOLD CORP.  
10TH FLOOR, 595 HOWE STREET  
VANCOUVER BC V6C 2T5

Dear Permittee:

Enclosed is amended permit 8415 issued under the provisions of the *Environmental Management Act*. Your attention is respectfully directed to the terms and conditions outlined in the permit. An annual fee will be determined according to the Permit Fees Regulation.

This permit does not authorize entry upon, crossing over, or use for any purpose of private or Crown lands or works, unless and except as authorized by the owner of such lands or works. The responsibility for obtaining such authority rests with the permittee. This permit is issued pursuant to the provisions of the *Environmental Management Act* to ensure compliance with Section 120(3) of that statute, which makes it an offence to discharge waste, from a prescribed industry or activity, without proper authorization. It is also the responsibility of the permittee to ensure that all activities conducted under this authorization are carried out with regard to the rights of third parties, and comply with other applicable legislation that may be in force.

This decision may be appealed to the Environmental Appeal Board in accordance with Part 8 of the *Environmental Management Act*. An appeal must be delivered within 30 days from the date that notice of this decision is given. For further information, please contact the Environmental Appeal Board at (250) 387-3464.

Administration of this permit will be carried out by staff from the Environmental Protection Division's Regional Operations Branch. Plans, data and reports pertinent to the permit are to be submitted by email or electronic transfer to the director, designated officer, or as further instructed.

Yours truly,

Mark P. Love P.Ag.  
for Director, *Environmental Management Act*

**MINISTRY OF  
ENVIRONMENT AND  
CLIMATE CHANGE  
STRATEGY**

**PERMIT**

**8415**

*Under the Provisions of the Environmental Management Act*

**SNIPGOLD CORP.**

**10TH FLOOR, 595 HOWE STREET  
VANCOUVER BC V6C 2T5**

is authorized to discharge mine influenced water to Johnny Creek, and Stonehouse Creek from the closed Johnny Mountain Gold Mine located 90 kilometres northwest of Stewart, British Columbia, subject to the requirements listed below.

Contravention of any of these requirements is a violation of the *Environmental Management Act* and may lead to prosecution.

This authorization supersedes and replaces all previous versions of Permit 8415 issued under Section 14 or 16 of the *Environmental Management Act*.

Where this authorization provides that the director may require an action to be carried out, the permittee must carry out the action in accordance with the requirements of the director.

The permittee must not discharge under this authorization unless the Authorized Works are complete and fully operational.

**1. AUTHORIZED DISCHARGES**

**1.1 Tailings Impoundment Supernatant and Seepage**

This section applies to the discharge of effluent from the tailings impoundment to Johnny Creek. The site reference number for this discharge is E207745 (JM5).

Date issued: June 6, 1990  
Date amended: June 10, 2019  
(most recent)

  
Mark P. Love P.Ag.  
for Director, *Environmental Management Act*  
Authorizations - North Region

- 1.1.1 The maximum limit for the rate of discharge is indeterminate.
- 1.1.2 The characteristics of the discharge must be equivalent to or better than:

Dissolved Copper  
Maximum: 0.05 mg/L

Dissolved Zinc  
Maximum: 0.2 mg/L

- 1.1.3 The discharge is authorized from Authorized Works, which are a tailings impoundment, spillway and discharge weir, seepage collection ditches and ponds, and related appurtenances approximately located as shown on Site Plan A.
- 1.1.4 The location of the facilities from which the discharge is authorized to originate and the point where the discharge is authorized to occur is Crown Grant Mineral Claims Reg 3 and Reg 4, Liard Mining Division.

## 1.2 Mine Water Discharges

This section applies to the portal seepage from the closed and reclaimed #10 level portal to Stonehouse Creek. The site reference number for this discharge is E213930 (JM4).

- 1.2.1 The maximum limit for the rate of discharge is indeterminate.
- 1.2.2 The characteristics of the discharge must be typical of groundwater seepages coming from #10 level portal.
- 1.2.3 The location of the facilities from which the discharge is authorized to originate and the point where the discharge is authorized to occur is the same as specified in section 1.1.4 above.

## 1.3 Waste Rock Seepage Discharges

This section applies to the discharge of seepage from the #10, #11 and #12 level waste rock piles to ground and Stonehouse Creek. The site reference numbers for the #10, #11 and #12 level seepage discharges are E236846 (JM3), E213931 (JM2) and E216683 (JM1), respectively.

Date issued: June 6, 1990  
Date amended: June 10, 2019  
(most recent)

for Director, *Environmental Management Act*  
Authorizations - North Region

- 1.3.1 The maximum limit for the rate of discharge is indeterminate.
- 1.3.2 The characteristics of the discharge must be typical of leachate, which has passed through inert waste rock.
- 1.3.3 The location of the facilities from which the discharge is authorized to originate and the point where the discharge is authorized to occur is the same as specified in section 1.1.4 above.

## 2 GENERAL PROVISIONS

### 2.1 Licence to Publish Documents

- 2.1.1 Subject to paragraph 2.1.2, the permittee authorizes the Province to publish on the Ministry of Environment and Climate Change Strategy website the entirety of any Regulatory Document.
- 2.1.2 The Province will not publish any information that could not, if it were subject to a request under section 5 of the *Freedom of Information and Protection of Privacy Act*, be disclosed under that Act.
- 2.1.3 The permittee will indemnify and save harmless the Province and the Province's employees and agents from any claim for infringement of copyright or other intellectual property rights that the Province or any of the Province's employees or agents may sustain, incur, suffer or be put to at any time that arise from the publication of a Regulatory Document.

### 2.2 Maintenance of Works and Emergency Procedures

#### 2.2.1 Maintenance of Works

The permittee must regularly inspect the Authorized Works and maintain them in good working order. If components of the Authorized Works have a manufacturer's recommended maintenance schedule, then those components must, at a minimum, be maintained in accordance with that schedule.

The permittee must maintain a record of inspections and maintenance of the Authorized Works, and make the record available to an officer upon request.

Date issued: June 6, 1990  
Date amended: June 10, 2019  
(most recent)

  
Mark P. Love P.Ag.  
for Director, *Environmental Management Act*  
Authorizations - North Region

2.2.2 **Emergency Procedures**

In the event of an emergency or other condition which prevents normal operation of the Authorized Works or leads to an unauthorized discharge, the permittee must take remedial action immediately to restore the normal operation of the Authorized Works and to prevent any unauthorized discharges. The permittee must immediately report the emergency or other condition and the remedial action that has and will be taken to the [EnvironmentalCompliance@gov.bc.ca](mailto:EnvironmentalCompliance@gov.bc.ca) email address or as otherwise instructed by the director.

3. **MONITORING REQUIREMENTS**

3.1 **Sampling Facilities**

The permittee must install and maintain, suitable to the director, sampling facilities. The permittee must collect samples at each site according to the schedule specified in Table 1. The permittee must take due care in sampling, storing and transporting the samples to control temperature and avoid contamination, breakage, and any other factor or influence that may compromise the integrity of the samples.

Table 1: Water Quality Sampling Requirements

Parameter	JM1	JM2	JM3	JM4	JM5	JM6	JM7	JM8	JM9

Hardness	A	A	A	A	A	A	A	A	A

A: Annual Water Quality Sample Required

3.2 **Water Quality Sampling Site Locations**

The permittee must collect the water quality samples at sampling site locations described in Table 2.

JM8	-	-	-	Duplicate sample from any one of the sampling stations
JM9	-	-	-	Travel blank

Note: GPS coordinates are Easting, Northing Zone 9, NAD 83

### 3.3 Analytical Procedures

The permittee must carry out analyses in accordance with procedures described in the "British Columbia Laboratory Manual (2015 Permittee Edition)", or the most recent edition or by alternative procedures as authorized by the director.

A copy of the above manual is available on the Ministry web page at <https://www2.gov.bc.ca/gov/content/environment/research-monitoring-reporting/monitoring/laboratory-standards-quality-assurance/bc-environmental-laboratory-manual>

### 3.4 Quality Assurance

The permittee is required to conduct the following quality assurance and control program to determine the acceptability of data required by this authorization and section 2(d) of the Environmental Data Quality Assurance Regulation.

- 3.4.1 The permittee must obtain from the analytical laboratory(ies) their precision, accuracy and blank data for each sample set submitted by the permittee and an evaluation of the data acceptability, based on criteria set

Date issued: June 6, 1990  
Date amended: June 10, 2019  
(most recent)

  
Mark P. Love P.Ag.  
for Director, *Environmental Management Act*  
Authorizations - North Region

by such laboratory.

- 3.4.2 The permittee must prepare and submit for analysis by the analytical laboratory(ies) a duplicate sample from one of the monitoring sites identified in Table 1 during each monitoring period.
- 3.4.3 The permittee must submit samples to analytical laboratory(ies) that meet the definition of a qualified laboratory under the Environmental Data Quality Assurance Regulation.
- 3.4.4 The permittee must report the results for each parameter of the field duplicates in terms of variation as the relative percent difference.
- 3.4.5 The permittee must prepare and submit to the laboratory a sample collection blank containing distilled water and preservative if required during each monitoring period. If any result for any parameter indicates detectable concentrations, then efforts must be made to determine and control the source of contamination.

### 3.5 **Sampling Procedures**

The permittee must carry out sampling in accordance with the procedures described in the "British Columbia Field Sampling Manual for Continuous Monitoring and the Collection of Air, Air-Emission, Water, Wastewater, Soil, Sediment, and Biological Samples, (2013 Permittee Edition)" or most recent edition, or by alternative procedures as authorized by the director.

A copy of the above manual is available on the Ministry web page at <https://www2.gov.bc.ca/gov/content/environment/research-monitoring-reporting/monitoring/laboratory-standards-quality-assurance/bc-field-sampling-manual>

## 4. **REPORTING REQUIREMENTS**

The permittee must, on or before each March 31 that occurs during the term of this authorization, submit an annual report for the preceding calendar year to the director, by email at [envauthorizationsreporting@gov.bc.ca](mailto:envauthorizationsreporting@gov.bc.ca) or as otherwise instructed by the director and includes, but is not limited to:

- a. a review and interpretation of the monitoring data for the preceding calendar year,

Date issued: June 6, 1990  
Date amended: June 10, 2019  
(most recent)

  
Mark P. Love P.Ag.  
for Director, *Environmental Management Act*  
Authorizations - North Region

- b. an evaluation of the laboratory analysis, and quality and precision based on the results of the quality assurance program required herein,
- c. an evaluation of the performance of the treatment works and identify any changes,
- d. an implementation schedule for any alterations to the treatment and disposal works which may impact the discharge under this authorization.

## 5. NON-COMPLIANCE REPORTING

### 5.1 Non-compliance Notification

The permittee must immediately notify the director or designate by email at [EnvironmentalCompliance@gov.bc.ca](mailto:EnvironmentalCompliance@gov.bc.ca), or as otherwise instructed by the director of any non-compliance with the requirements of this authorization and take remedial action to remedy any effects of such non-compliance.

The permittee must provide the director with written confirmation of all such non-compliance events, including available test results within 24 hours of the original notification by email at [EnvironmentalCompliance@gov.bc.ca](mailto:EnvironmentalCompliance@gov.bc.ca), or as otherwise instructed by the director.

### 5.2 Non-compliance Reporting

If the permittee fails to comply with any of the requirements of this authorization, the permittee must, within 30 days of such non-compliance, submit to the director a written report that includes, but is not necessarily limited to, the following:

- a. all relevant test results obtained by the permittee related to the non-compliance,
- b. an explanation of the most probable cause(s) of the non-compliance, and
- c. a description of remedial action planned and/or taken by the permittee to prevent similar non-compliance(s) in the future.

The permittee must submit all non-compliance reporting required to be submitted under this section by email to the Ministry's Compliance Reporting Submission Mailbox (CRSM) at [EnvironmentalCompliance@gov.bc.ca](mailto:EnvironmentalCompliance@gov.bc.ca) or as otherwise instructed by the director. For guidelines on how to report a non-compliance or for more information visit the Ministry website:

for Director, *Environmental Management Act*  
Authorizations - North Region

<https://www2.gov.bc.ca/gov/content/environment/waste-management/waste-discharge-authorization/data-and-report-submissions/compliance-reporting-mailbox>

## 6 **Spill Reporting**

The permittee must immediately report all spills to the environment (as defined in the Spill Reporting Regulation) in accordance with the Spill Reporting Regulation, which among other things, requires notification to Emergency Management BC at 1-800-663-3456.

## 7. **GLOSSARY**

Capitalized terms referred to in this authorization are defined below. Other terms used in this authorization have the same meaning as those defined in the *Environmental Management Act* and applicable regulations.

### 7.1 **“Authorized Works”**

“Authorized Works” means a tailings impoundment, spillway and discharge weir, seepage collection ditches and ponds, and related appurtenances as stated in Section 1.1.3;

### 7.2 **“Regulatory Document”**

“Regulatory Document” means any document that the permittee is required to provide to the director or the Province pursuant to:

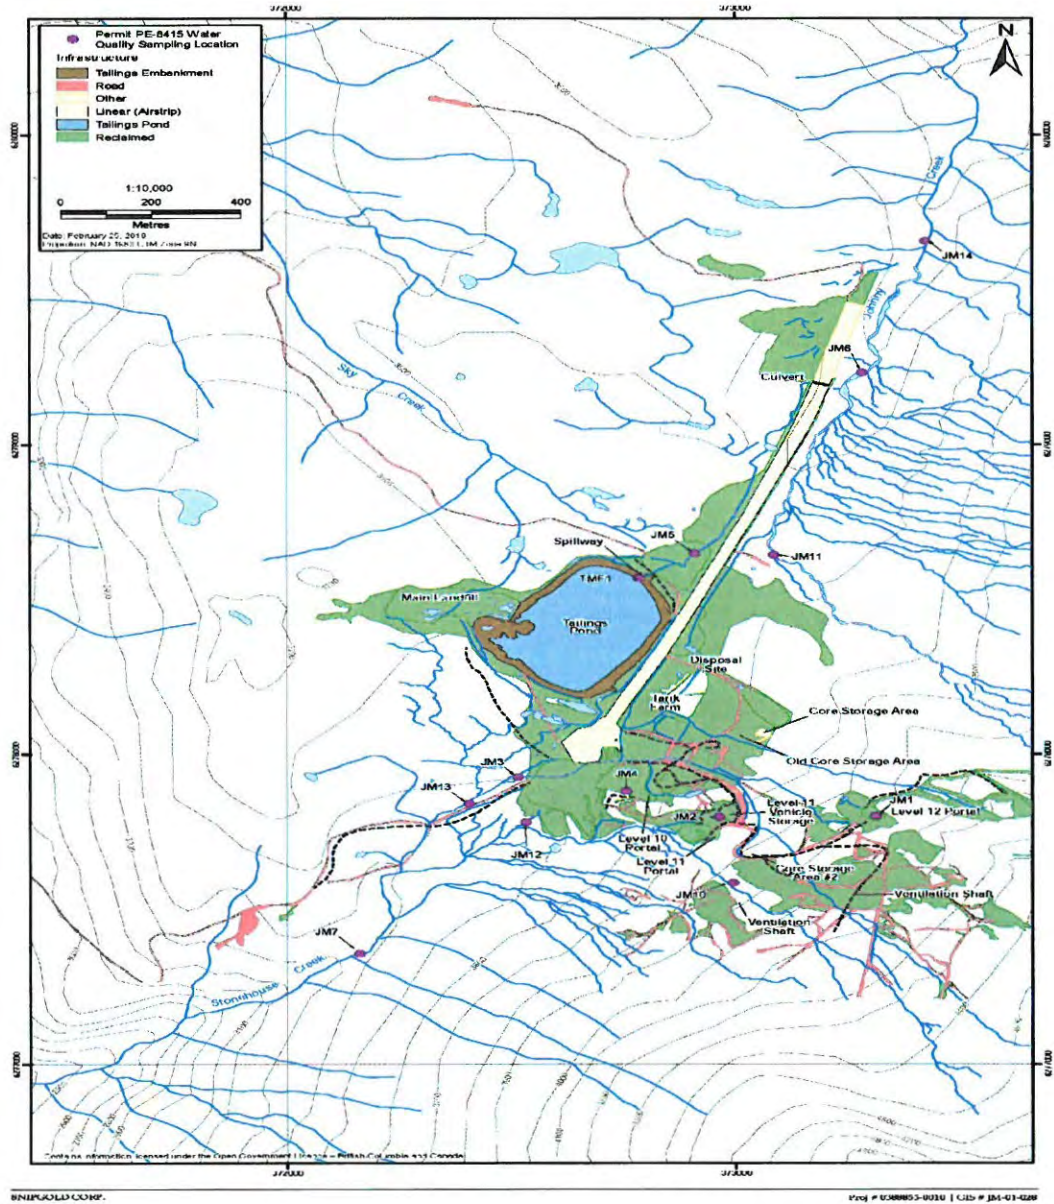

- i. this authorization;
- ii. any regulation made under the *Environmental Management Act* that regulates the facility described in this authorization or the discharge of waste from that facility; or
- iii. any order issued under the *Environmental Management Act* directed against the permittee that is related to the facility described in this authorization or the discharge of waste from that facility;

F: +1 604 687 4277

## EXECUTIVE SUMMARY

The Johnny Mountain Mine is a closed underground gold mine located in the Coast Mountain Range of British Columbia, approximately 100 km northwest of Stewart, BC. The site is situated on a sub-alpine plateau near the confluence of the Craig and Iskut Rivers. The northwest face of Johnny Mountain is covered by an alpine glacier.

The underground mine has been closed since 1993, and reclamation activities have taken place sporadically on the site from 1999 to 2016. Seabridge Gold Inc. acquired SnipGold, now a subsidiary of Seabridge Gold Inc. on June 21, 2016. The Johnny Mountain Mine site, along with the surrounding mineral tenures and the Bronson Airstrip, make up the Iskut Project (the Project).

During the summer of 2016, a new meteorological station was installed on the Johnny Mountain plateau. The station has been serviced and maintained throughout 2016 to 2020. The station includes a network camera and satellite telemetry connection, and hosts a website to display up-to-date and historical data.

This report presents data from the meteorological station from August 2016 to October 2020. Section 2 presents the methodology used for the fieldwork and analysis, Section 3 presents results, and Section 4 presents a short summary. All data (monthly, daily and hourly) are included as appendices to this report.

During the monitoring period of August 2016 to October 2020, average air temperature was 0.8°C with daily average mean temperature ranging from 19.6°C (June 19, 2018) to -24.4°C (February 2, 2019). The mean relative humidity records indicate that fog and low clouds were present at the Johnny Mountain plateau approximately 36% of the time during the reporting period. The monthly average total precipitation adjusted for wind undercatch ranged from 86 mm in April to 237 mm in November, and the maximum daily precipitation recorded during the monitoring period was 66 mm on January 1, 2019. **Missing daily temperature and precipitation data were estimated using regression analysis with data from the KSM Project meteorological stations. The estimation methodology was found to be satisfactory to predict missing daily temperature and precipitation data.** The snow season typically extends from October to May and the snowpack reaches its maximum depth in March or April. The maximum daily snowpack depth during the monitoring period was 220 cm recorded on March 16, 2020.

Winds were predominantly from the southwest quadrant during warm months and from the northeast during the wintertime. Northeastern winds were characterized by higher speeds. The average wind speed during the period of record was 4 m/s while 33% of time the wind speed ranged from 3 to 5 m/s. Calm winds occurred 1.7% of time. The maximum hourly average wind speed was 30 m/s (108 km/h) and the maximum wind gust speed was 45.1 m/s (162 km/h), both occurred on January 15, 2020. The hourly average solar radiation ranged from 0 to 990 W/m<sup>2</sup>, peaking during the summer.

WMO	World Meteorological Organization

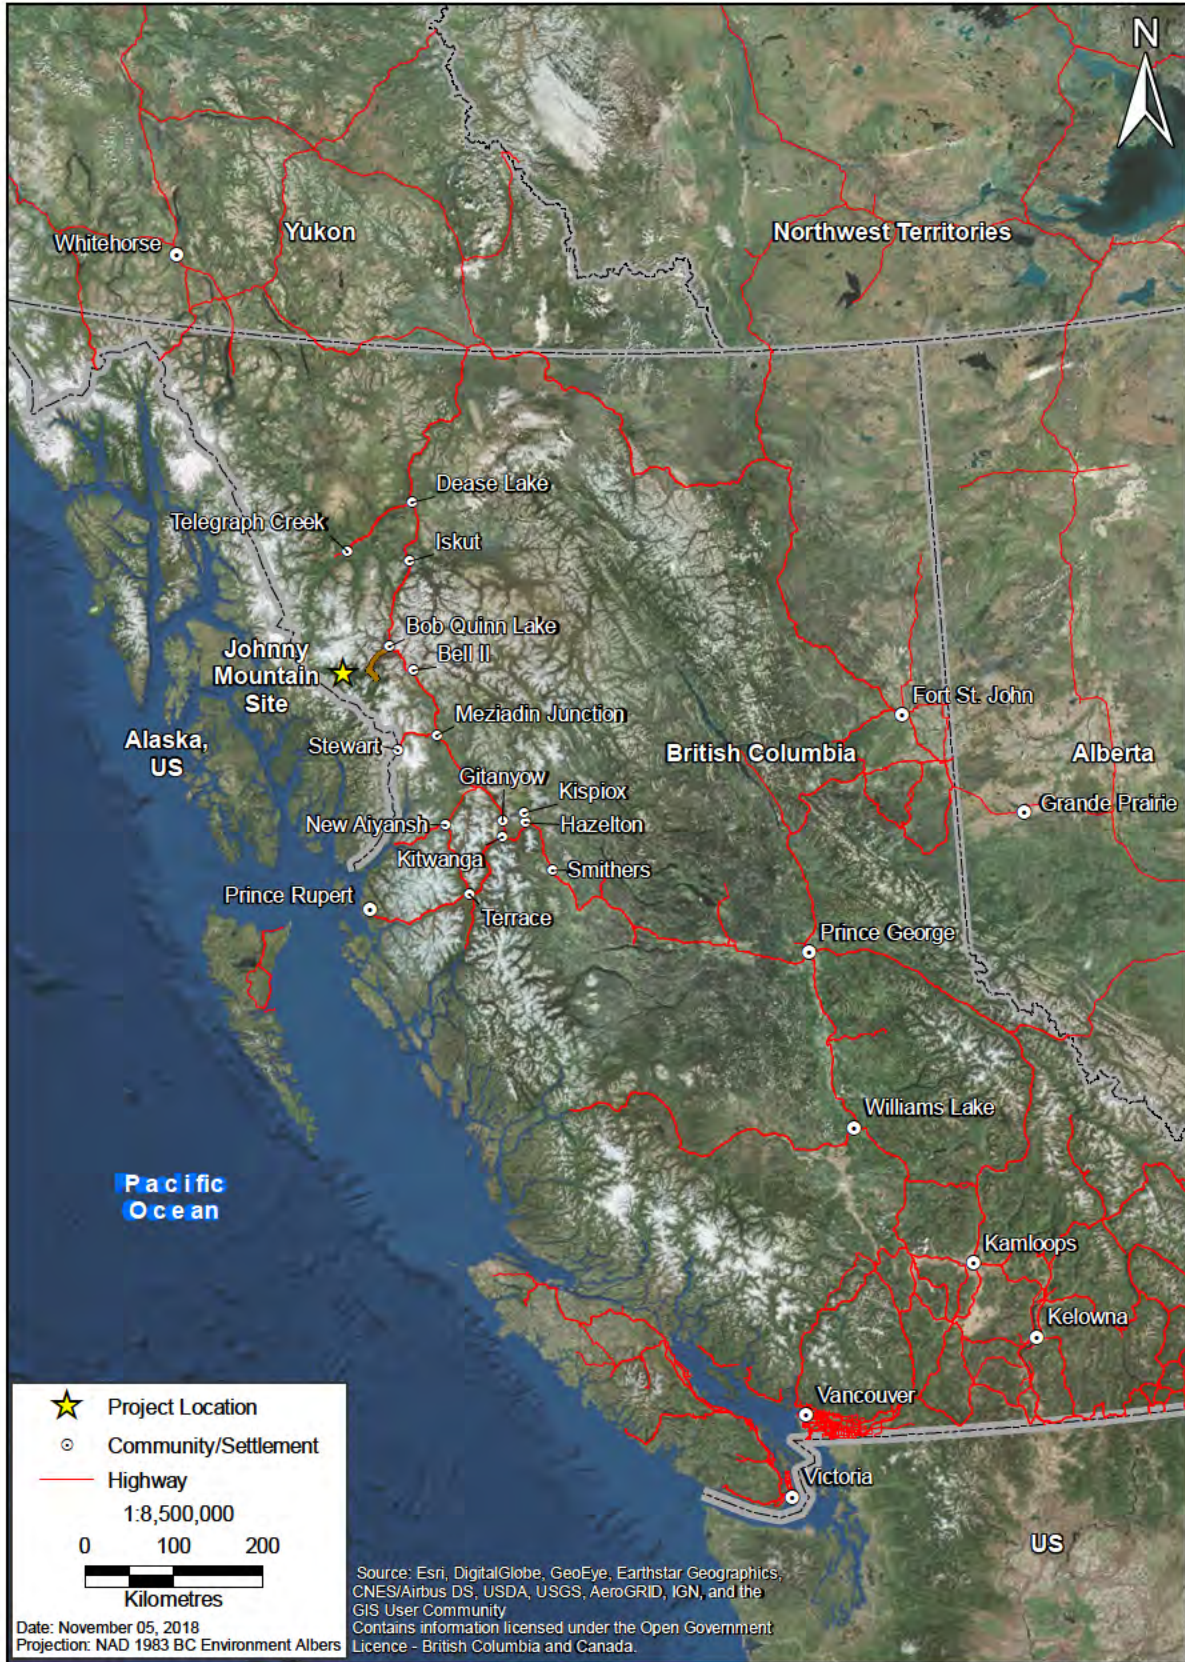

## 1. INTRODUCTION

The Johnny Mountain Mine is a closed underground gold mine located in the Coast Mountains Range of British Columbia (BC), approximately 100 kilometres (km) NW of Stewart, BC (Figure 1-1). The mine is located on a sub-alpine plateau near the confluence of the Craig and Iskut Rivers on the northwest face of Johnny Mountain, where an alpine glacier covers higher altitudes of the Mountain.

The underground mine has been closed since 1993, and reclamation activities have taken place sporadically on the site from 1999 to 2016. Seabridge Gold Inc. acquired SnipGold on June 21, 2016. The Johnny Mountain Mine site, along with the surrounding mineral tenures and the Bronson Airstrip, make up the Iskut Project (the Project).

During the summer of 2016 a new meteorological station was installed on the Johnny Mountain plateau. The station has been serviced and maintained throughout 2016 to 2020. The station includes a network camera and satellite telemetry connection, and hosts a website to display up-to-date and historical data.

This report presents data from the meteorological station from August 2016 to October 2020. Section 2 presents the methodology used for the fieldwork and analysis, Section 3 presents results, and Section 4 presents a short summary. All monthly, daily and hourly data are included as appendices to this report.

**Figure 1-1: Project Location**

## 2. METHODOLOGY

### 2.1 Historical Meteorological Stations

Two government meteorological stations (ECCC 2020) were operational historically on Johnny Mountain (1988 to 1992) and near the Bronson airstrip (1989 to 1999). Hence, no local government meteorological data are available for the area after 1999.

Environment and Climate Change Canada (ECCC) reported locations of the historical Johnny Mountain and Bronson Creek stations are based on the available latitude and longitude locations, which have limited precision (ECCC 2020). The converted UTM coordinates of these two stations represent estimated locations and their reported elevations do not agree with the elevation of their reported latitude and longitude. Based on the elevation data, it is likely that the stations were located close to the Johnny Mountain Airstrip and the Bronson Creek Airstrip, respectively. Table 2.1-1 and Figure 2.1-1 present the historical locations as they are reported by ECCC.

Table 2.1-1: Current Project and Historical Meteorological Stations in the Iskut Project Area

Station Name	Reporting Organization	Data Reporting Period	UTM Coordinates <sup>1</sup>		Elevation (masl)
			Easting (m)	Northing (m)	
Project Station					
Johnny Mountain	SnipGold	July 28, 2016 to present	371942	6278283	1,143
Historical Stations					
Johnny Mountain	ECCC	April 1, 1988 to September 30, 1992	372211	6278512	1,075
Bronson Creek	ECCC	May 15, 1989 to September 30, 1999	371302	6282252	107

<sup>1</sup> UTM Zone 9V, NAD83

### 2.2 Johnny Mountain Project Meteorological Station

SnipGold's Johnny Mountain meteorological station was installed on the Johnny Mountain plateau on July 28, 2016. It is located on the western side of the plateau approximately 500 m west of the Tailing Storage Facility (Table 2.1-1; Figure 2.1-1; and Photos 2.2-1 and 2.2-2).

The current Johnny Mountain station and sensors were installed according to the sensor siting guidelines developed by Environment Canada (EC 2004, 2012) and the British Columbia Ministry of Environment (BC MOE 2016). These guidelines, wherever possible, follow standards set by the World Meteorological Organization (WMO) and were established to promote standardization and describe practices, procedures and specifications for proper siting of instruments, precision and accuracy of measurements, and archive formats. The station location was selected to avoid any obstructions or shaded areas that would bias wind speed and direction or solar radiation. The wind sensor is located over open and relatively level terrain. The height of the wind sensor is 10 metres above the ground, which is the standard reference height for wind measurements (EC 2004, 2012). The temperature and relative humidity sensor is shaded from solar radiation by a shield that is adequately ventilated.

The meteorological station was programmed according to EC and BC MOE guidelines to automatically log hourly average data for air temperature, relative humidity, solar radiation, snow depth, wind speed, wind direction and standard deviation of wind direction; in addition to five-minute and hourly total accumulated precipitation, hourly average battery power supply voltage and hourly camera

images during the daytime. Daily maximum and minimum air temperature, daily maximum wind speed, the wind direction at maximum speed, the time when the maximum wind speed was observed and the total daily precipitation are logged each day at midnight.

Table 2.2-1: Johnny Mountain Station Sensors and Equipment Installed in February 2019<sup>1</sup>

Description	Make	Model	Serial Number
Wind speed and direction sensor	RM Young	05305	WM131021
Air temperature and relative humidity sensor	Vaisala <sup>2</sup>	HMP45C212 <sup>2</sup>	C2080

Solar radiation sensor	Kipp & Zonen	SP Lite2	140075
Snow depth sensor	Campbell Scientific	SR50A	6034
Precipitation sensor	Geonor <sup>3</sup>	T-200BMD	41516 <sup>4</sup>
Network camera	Campbell Scientific	CCFC	1057 <sup>4</sup>
Datalogger	Campbell Scientific	CR1000-XT	78496 <sup>4</sup>
Satellite telemetry modem	Hughes	9502 BGAN	-

Notes:

Dash (-) = not available or not applicable

<sup>1</sup> Newly recalibrated sensors were installed in February 2019; old sensors that were removed from the station were sent to Campbell Scientific for repair and calibration.

<sup>2</sup> Sensor installed in September 2020

<sup>3</sup> New transducers installed in September 2020

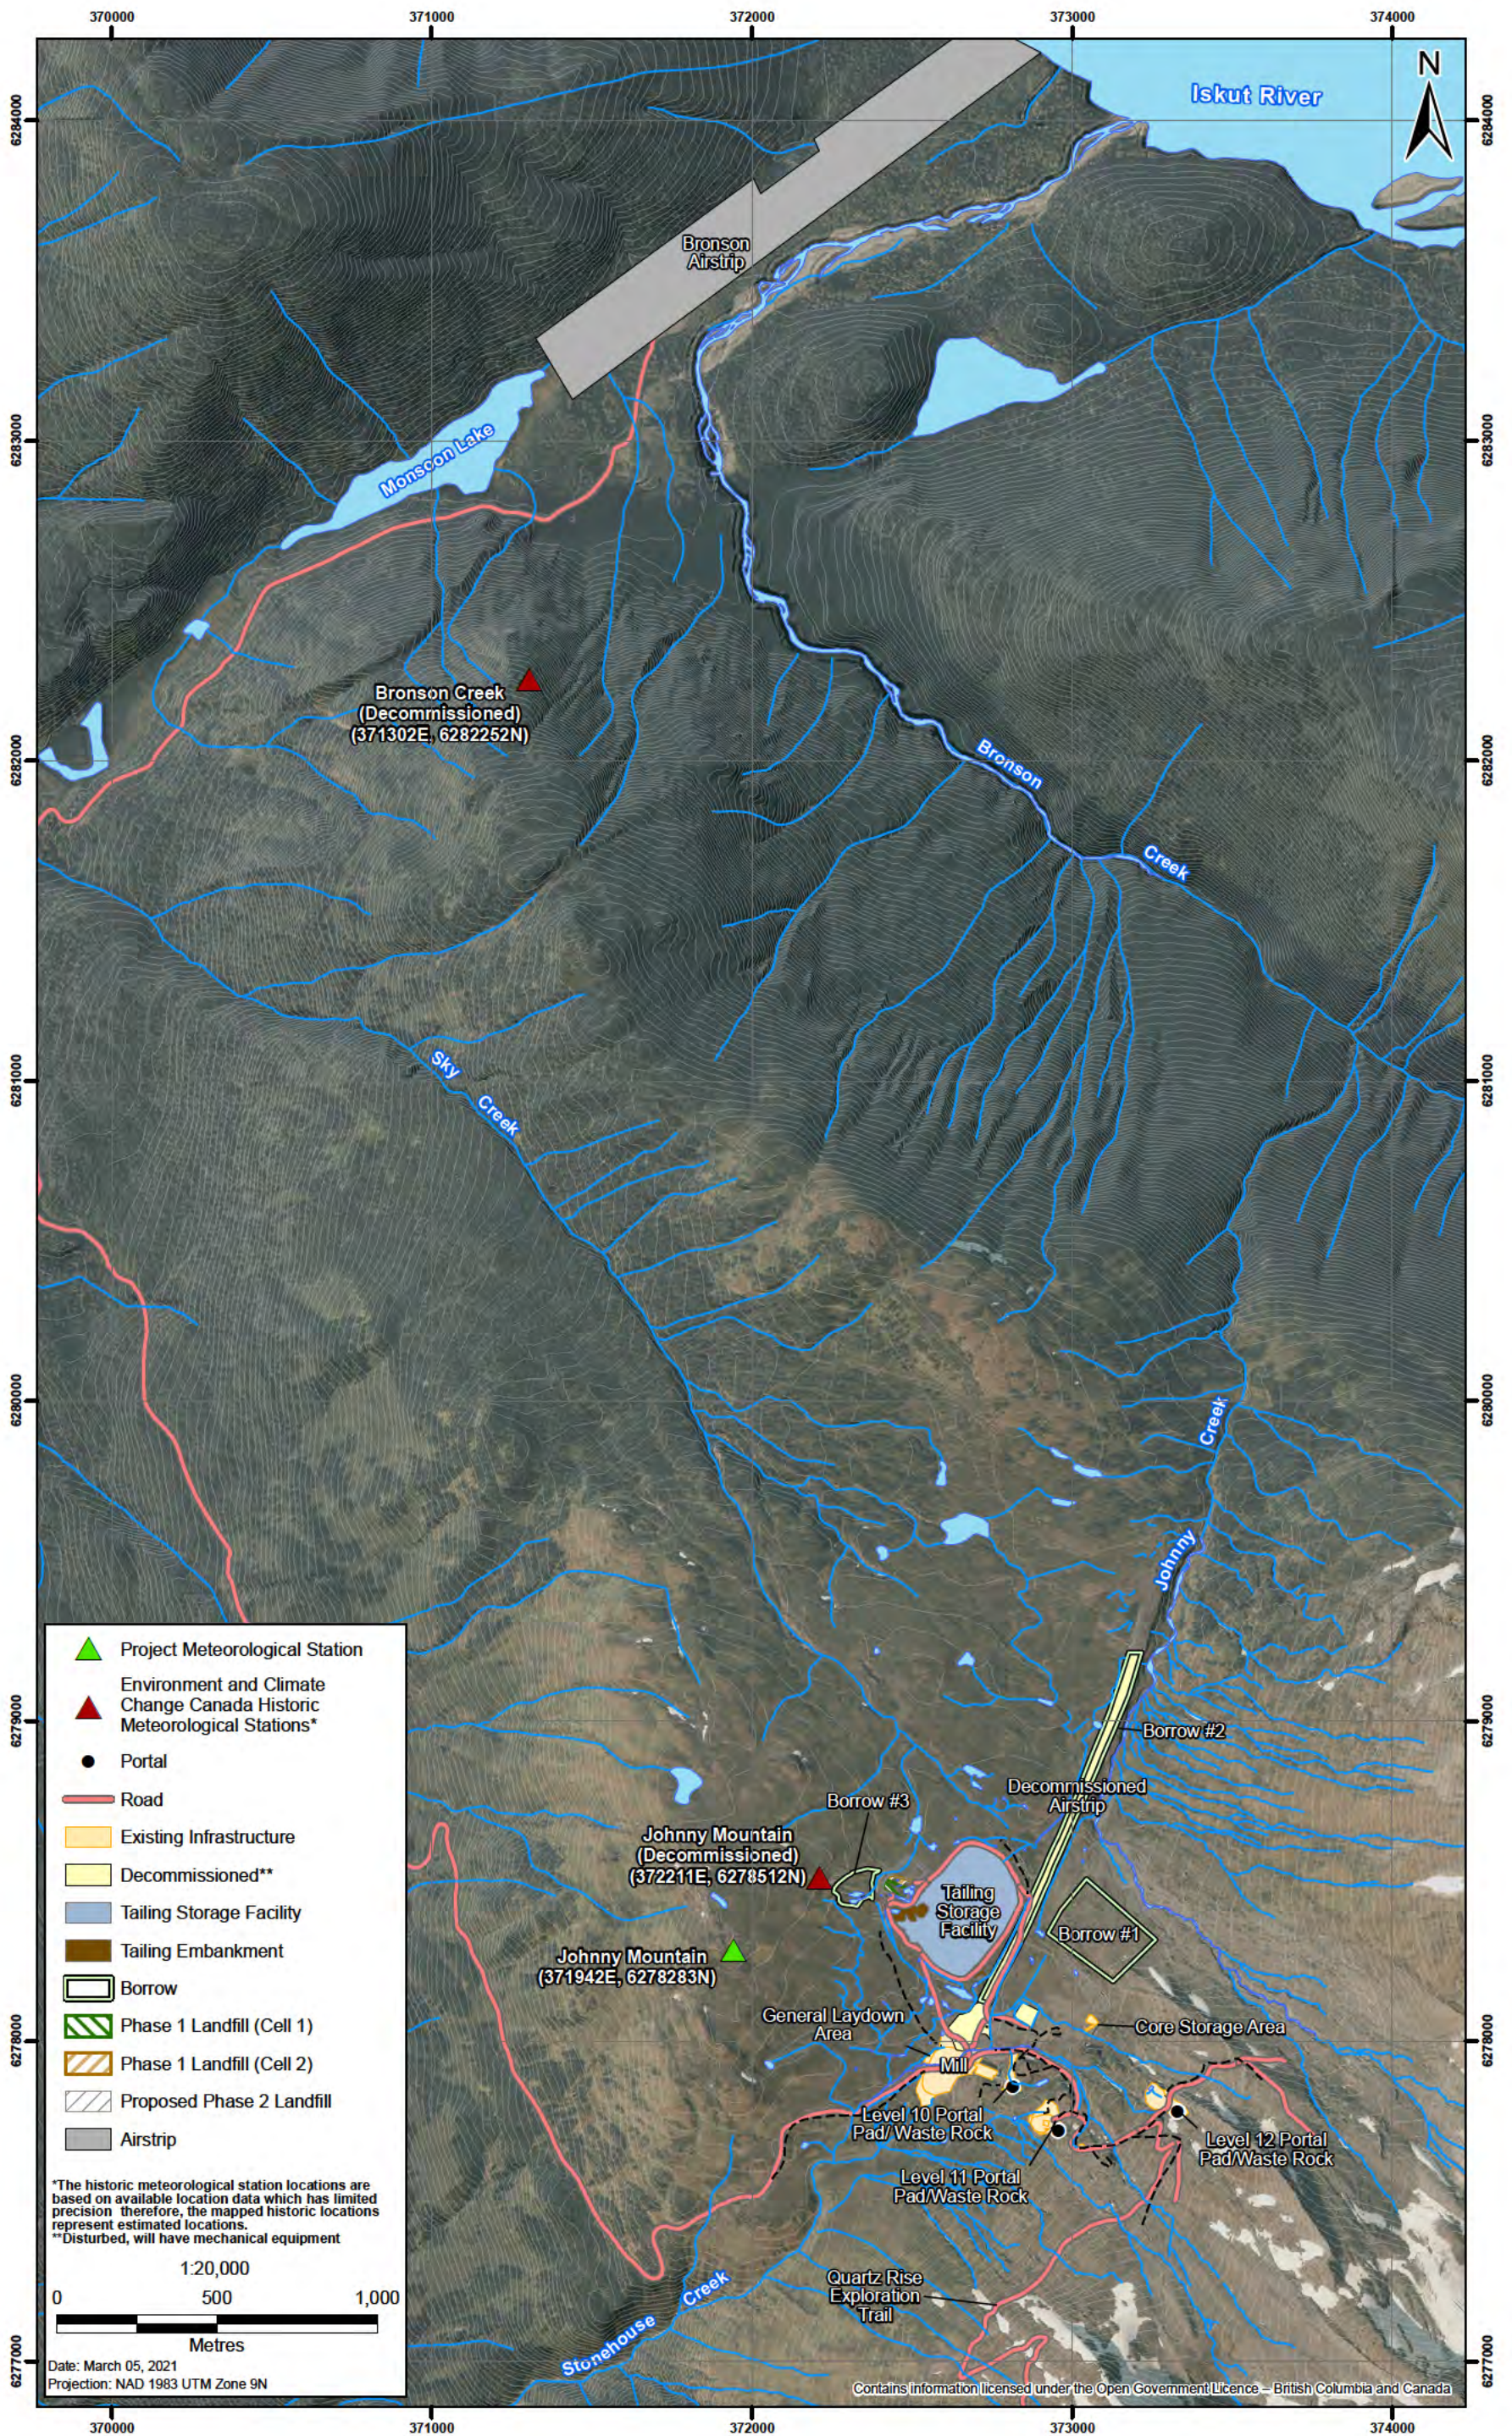

<sup>4</sup> Unit was not replaced since its first install in July 2016.

The sensors and equipment that were installed on the Johnny Mountain station are summarized in Table 2.2-1. A photo of the station with labelled sensors and equipment components is included in Appendix D.

A satellite telemetry system is installed on the station to allow for remote communication access to the station. The satellite telemetry system allows for remote two-way communication including downloading of data and viewing of the latest hourly data and controlling and modifying the station datalogger remotely. Telemetry also allows for faster identification and resolution of instrumentation issues, and more informed planning for field visits. The satellite telemetry system power supply is kept independent of the datalogger power supply because the satellite system uses more power than the datalogger. Separate power supplies allow the datalogger to continue to collect data in the event that the satellite telemetry system power supply runs low, preventing meteorological data gaps.

A maintenance program is in place for the Johnny Mountain meteorological station. When necessary, the sensors are returned to the supplier for calibration because specialized equipment is required for most calibration procedures. The recommended recalibration intervals are every one or two years, depending on the particular sensor or piece of equipment.

Meteorological station maintenance site visits were conducted by experienced technicians to ensure that installation and maintenance were conducted properly (Table 2.2-2). During each site visit, data were downloaded and reviewed and sensors and equipment were checked to ensure that they were operating normally.

### 2.3 Data Analysis

All meteorological data were reviewed after collection in order to filter out or correct any erroneous values. The screening process used by RTEC draws on screening criteria used by the United States Environmental Protection Agency (US EPA 2000), EC (EC 2004), and the BC MOE (2016), as well as using professional judgement and experience (Figure 2.3-1). Erroneous data were marked as missing; the periods of missing and erroneous data are summarized in Table 2.3-1. After data were screened, the recorded hourly and daily values were analysed and processed into daily and monthly summaries.

As an example, during months with snowfall, the snow depth data were used to verify precipitation events. If snow depth increased but the precipitation gauge did not record any precipitation during the same time period, it was likely that there was a snow cap blocking the precipitation gauge orifice. The hourly network camera photos of the precipitation gauge were also used to determine whether the gauge was blocked by snow. In these cases, precipitation data were marked as missing. Large winter precipitation events recorded by the precipitation gauge were also verified by comparing the event with the snow depth change over the same period.

Similar to most precipitation gauges, the Geonor T-200B series, have a precipitation collection orifice located above ground level, which results in wind turbulence being generated in the vicinity of the gauge. The amount of air turbulence generated depends on the gauge shape and the wind speed. The turbulence alters the trajectory of a falling precipitation particle, and can cause the particle to miss the precipitation gauge's collection orifice completely, especially in the case of solid precipitation (e.g., snow). The Geonor precipitation gauge used at the Project is fitted with a single Alter wind screen, which reduces wind speed around the gauge thus decreasing, but not eliminating, the amount of wind-induced undercatch.

Notes:

<sup>1</sup> The satellite antenna was found to be out of alignment and the Alter windscreen was repaired. These issues were due to numerous periods of high winds during the 2016-2017 winter, up to hurricane wind gust speeds of 34 m/s (122 km/h).

<sup>2</sup> The camera was damaged on February 13, 2017, likely due to heavy snow and ice loading on the camera's rear cable connector, which caused the connector junction to snap.

Note:

<sup>1</sup> The website [www.lightningmaps.org](http://www.lightningmaps.org) shows that there were three lightning strikes within 5 km of the Johnny Mountain station on July 9, 2019 between 0:45 am and 1:48 am PDT, which matches the time when the station recorded its last data prior to being repaired on August 21, 2019.

The wind-induced undercatch can be accounted for using catch efficiencies for single Alter wind screens (Rasmussen et al. 2012). The catch efficiency (CE) method used in this report was developed by MacDonald and Pomeroy (M & P 2007) to quantify the catch efficiency of Geonor T-200B precipitation gauges with single Alter wind screens. RTEC compared the M & P methodology against other methodologies and found the M & P method outperformed other methods when applied to the snowfall characteristics of the BC coastal region.

The catch efficiency equation developed by M & P is:

$$CE = 1.01 \times \exp(-0.09 \times U)$$

Where CE is the catch efficiency of a single Alter wind screen Geonor precipitation gauge referenced to true snowfall, and U is the wind speed (m/s) at the Geonor orifice gauge height. These undercatch equations are not applied to rainfall because the catch efficiency is near 100% for all wind speeds (C. Smith, National Hydrology Research Center, pers. comm. 2011). For this report, the equation was applied to daily total SWE and daily mean wind speed datasets.

Each catch efficiency equation requires wind speed at the precipitation gauge orifice; the logarithmic wind profile (assuming neutral atmospheric stability; Stull 2016) was used to estimate wind speeds at the height of the precipitation gauge's orifice. The logarithmic wind profile equation is:

$$U_2 = U_1 \times \ln(z_2/z_0) / \ln(z_1/z_0)$$

Where  $U_1$  is the wind speed at height above ground  $z_1$ ,  $U_2$  is the wind speed at height above the ground  $z_2$ , and  $z_0$  is the aerodynamic surface roughness length. For this report,  $z_0$  was assumed to be 0.017 m which is a typical value for snow covered ground,  $z_1$  was the height of the wind speed measurement (10 m), and  $z_2$  was the height of the Geonor precipitation gauge orifice (3.3 m). The  $z_2$  and  $z_1$  values were assumed to remain constant although in reality they would change with fluctuating snow pack levels.

Total precipitation data were then separated into daily rainfall and snowfall based on daily air temperature data and followed the methodology provided by Quick (1995). The algorithm is as follows:

$$\begin{aligned} \text{if } T > 2 \text{ then} & \quad R = P, \text{ and } SWE = 0 \\ \text{if } T < 0 \text{ then} & \quad R = 0, \text{ and } SWE = P \\ \text{if } 0 < T < 2 \text{ then} & \quad R = P \times T/2, \text{ and } SWE = P \times \left(1 - \left(\frac{T}{2}\right)\right) \end{aligned}$$

where T = Mean Daily Air Temperature (°C)  
P = Daily Precipitation (mm)  
R = Daily Rainfall (mm)  
SWE = Daily Snow-Water-Equivalent (mm)

Erroneous data (e.g., abnormal trends or outliers) were excluded from the finalized datasets. Periods of missing or erroneous temperature or precipitation data were gap-filled using data from the KSM Project meteorological stations.

Missing daily precipitation and temperature data were calculated using linear regression equations between data from the Johnny Mountain meteorological station and KSM Project meteorological stations (Table 2.3-2). The equation with the highest correlation coefficient ( $R^2$ ) value was used for the calculation. Precipitation equations were derived by using orthogonal regressions on concurrent historical monthly precipitation datasets between all stations. Orthogonal regressions were used because the resulting equations had better  $R^2$  values than using regular linear regressions. The precipitation equations were developed using total monthly precipitation datasets but were applied to the daily dataset. The original offset values were divided by the average number of days per month (30.5). When applying these equations, any resulting negative precipitation values were set to zero. Also, if a source value was zero, the resulting value was also set to zero. Temperature equations were derived using normal linear regression on concurrent historical daily temperatures between all stations and were applied to the daily dataset.

Table 2.3-2: Linear Relationship Equations between Johnny Mountain and KSM Project Meteorological Stations Applied to Gap Fill Daily Precipitation and Temperature Data, August 2016 - October 2020

Linear Equation $Y = mX + b$				R2	Number of Monthly Data Points Pairs; n
Daily Total Precipitation "Y" (mm)	Daily Total Precipitation "X" (mm)	Slope "m"	Intercept "b"		
Johnny Mountain	Eskay Creek Mine	0.659	1.380	0.340	30
	Mitchell Deposit	1.233	-0.043	0.659	25
	Sulphurets Creek	1.474	-0.271	0.786	28
	Teigen Creek	1.993	-0.848	0.581	20
	Unuk-Teigen	0.904	0.168	0.643	13
Air Temperature "Y" (°C)	Air Temperature "X" (°C)				Number of Daily Data Points Pairs; n
Johnny Mountain	Eskay Creek Mine	0.937	-1.809	0.962	1,293
	Mitchell Deposit	1.004	-2.138	0.976	1,296
	Sulphurets Creek	1.027	1.441	0.965	1,265
	Teigen Creek	0.867	0.446	0.956	1,261
	Unuk-Teigen	0.944	0.938	0.969	1,256

To validate the results of the estimation methodology, the regression equations were applied to periods of available daily temperature and precipitation data from the Johnny Mountain station; hence, a comparison between predicted and recorded data was performed. The difference in the annual total precipitation between the estimated and recorded data ranged from - 5% to +5%, indicating that the methodology of estimating daily precipitation is satisfactory for the purpose of calculating total annual precipitation. The estimated daily mean temperatures were on average 0.6°C higher than the recorded daily data, indicating a slight overestimation of the temperature data. However, the estimated daily temperature data are based on a high  $R^2$  value (0.976; Table 2.3-2), which is satisfactory in terms of regression analysis.

### 3. RESULTS

The Johnny Mountain post processed (gap-filled and quality controlled) meteorological station data collected from August 2016 to October 2020 for air temperature, relative humidity, precipitation, snow depth, wind speed and direction and solar radiation are presented in this section and compiled in the following appendices:

- o Appendix A: 2016 - 2020 Summary of Monthly Meteorological Data;
- o Appendix B: 2016 - 2020 Daily Meteorological Data; and
- o Appendix C (digital): 2016 - 2020 Hourly Meteorological Data.

Table 3-1 presents monthly data averages for the Johnny Mountain meteorological station for the reporting period (August 2016 - October 2020). The historical Johnny Mountain and Bronson Creek stations are presented in Table 3-2 along with the current Johnny Mountain station data for comparison in air temperature, precipitation, and snow depth.

#### 3.1 Air Temperature and Humidity

For the available monitoring data from August 2016 to October 2020 (Figure 3.1-1 and 3.1-2; Table 3-1; Appendix A to C), the average air temperature was 0.8°C with a daily average range from -24.4°C (February 2, 2019) to 19.6°C (June 19, 2018). The absolute temperature ranged between a minimum of -26.8°C (February 2, 2019) to a maximum of 24.8°C (July 31, 2020). Temperatures tended to steadily rise above freezing from late March to early April, and fall below zero in October. Several Arctic outbreaks tended to occur from December through early March, resulting in many days with temperatures dropping below -15°C (Figure 3.1-1). Table 3-1 shows that the monthly average air temperature of all months is below 10°C with 6 months (November to April) below 0°C. The coldest month is February with an average of -8.1°C, while the warmest is July with an average of 9.6°C. According to Koppen-Geiger climate classification (Peel et al. 2007), these monthly temperature ranges correspond to a Dfc (D: Cold climate, f: Without dry season, c: Cold summer) climate class, which is described as a subarctic climate characterized by a cool summer and an absence of a dry season. Similar monthly temperature ranges were recorded at the historical Johnny Mountain station (Table 3-2).

The hourly relative humidity levels  $\geq 95\%$  recorded at the station occurred approximately 36% of the available record. High relative humidity measurements ( $\geq 95\%$ ) indicate that fog has likely formed at the station's location, and therefore visibility is reduced during these periods. The area on the Johnny Mountain plateau is notorious for having frequent periods of reduced visibility from fog and low level clouds as evident from the humidity measurements and the hourly network camera photos.

#### 3.2 Precipitation

During the August 2016 to October 2020 monitoring period, the monthly average total precipitation ranged from 86 mm in April to 237 mm in November (Tables 3-1 and 3-2; Figure 3.2-1). The wettest month during the monitoring period was November 2019 (450 mm; estimated), while the driest was May 2019 (39 mm; estimated; Figure 3.2-1, Appendix A). As mentioned in Section 3.1, the climate is characterized by an absence of a dry season as a result of the alpine location of the station that is relatively adjacent to the coast. The average monthly total precipitation at the Johnny Mountain station correspond to the records of the historical Johnny Mountain station (Table 3-2).

The majority of the rainfall records correspond to months with average air temperature above 0°C (May to October) with the highest monthly average rainfall was recorded in August, while the highest monthly average snow water equivalent (SWE) was recorded in January (Table 3-1).

The tabulated monthly data for each historical regional station were calculated from the monthly values averaged over all available years of data for each station.

Source for the historic Johnny Mountain and Bronson Creek station data: ECCC (2019).

<sup>1</sup> Gap-filled temperature.

<sup>2</sup> The Johnny Mountain (Aug 2016 - Oct 2020) data are the mean monthly snow depth. The historical Johnny Mountain (1988 - 1992) and Bronson Creek (1989 - 1999) data are the mean values from the snow depth on the last day of each month.

<sup>3</sup> Adjusted and gap-filled precipitation.

Note: Light coloured areas represent gap filled data

**Figure 3.1-1: Johnny Mountain Daily Mean Temperature, August 2016 - October 2020**

Note: Light coloured areas represent gap filled data

**Figure 3.1-2: Johnny Mountain Daily Minimum and Maximum Temperature, August 2016 - October 2020**

*Note: Data from April 2019 onward are estimated*

**Figure 3.2-1: Johnny Mountain Daily Total Precipitation and Annual Accumulated Precipitation, August 2016 - October 2020**

During the monitoring period, the highest total daily precipitation was 66 mm (estimated and adjusted for wind undercatch) recorded on January 1, 2019. During the same day, the Eskay Creek Mine, the Mitchell Creek and the Sulphurets2 meteorological stations from the KSM Project recorded 73 mm, 58 mm and 43 mm, respectively. The annual precipitation at the Johnny Mountain station (observed and estimated) ranged from 1,460 mm in 2018 to 2,034 mm in 2019 (available records for 2016 and 2020 do not cover the entire year).

The highest amount of precipitation over an hourly period as well as over a five minute period were recorded before the power outage occurred on the night of July 9, 2019, which indicates a very intense thunderstorm that caused the power outage. The highest hourly precipitation was 13.4 mm recorded from 0000 hours to 0045 hours on July 9. The power outage occurred at 0045 hours; therefore, the 13.4 mm fell over a period of 45 minutes only and not a full hour. The highest five minute amount of precipitation was 4.5 mm recorded at 0045 hours on July 9 (the last available five-minute record before the power outage). These precipitation records are validated against available observations in the region.

### 3.3 Snow Depth

During the August 2016 to October 2020 monitoring period, snow often began to accumulate from early October to early November and reached its maximum daily mean depth in late March to late April. The ground around the station became snow free each year from mid May to early June (Figure 3.3-1). The maximum daily snow depth recorded in the station was 220 cm on March 16, 2020. The 2019/2020 winter season recorded the highest snowpack (Figure 3.3-1).

The snow depth data recorded by the meteorological station is representative of the area around the station. High winds on the plateau area (see Section 3-5) have a large impact on the amount of snow that is entrained and redistributed by winds. This redistribution causes high variability in the snow pack depth in the area.

### 3.4 Solar Radiation

During the August 2016 to October 2020 monitoring period, hourly mean solar radiation ranged from 0 to 990 Watts per square metre ( $W/m^2$ ). The potential maximum daily mean solar radiation follows a smooth sinusoidal pattern over the course of a year (Figure 3.4-1), in relation to the amount of sunlight received by the surface. The amount of solar radiation received on the ground primarily depends on the time of day, the time of year and the amount of cloud cover. The plotted troughs in Figure 3.4-1 (e.g., July 2020) give an indication of the amount and duration of cloud cover on each day.

### 3.5 Wind Speed and Direction

During the August 2016 to October 2020 monitoring period, winds predominantly blew from the southwest quadrant, particularly during warmer months (May to September), with a secondary predominant direction from the northeast (Figure 3.5-1). Northeastern winds were characterized by higher speeds and blew mostly during wintertime. These predominant wind directions are parallel with the alignment of the old existing Johnny Mountain Airstrip.

The average wind speed was 4 m/s with most frequent speeds were between 3 and 5 m/s (33%). Calm winds ( $< 0.5$  m/s) occurred 1.7% of the time and winds  $\geq 11$  m/s occurred 0.8% of the time. The maximum hourly average wind speed was 30 m/s (108 km/h) and the maximum wind gust speed was 45.1 m/s (162 km/h) both occurred on January 15, 2020. For comparison, a category two hurricane has sustained wind speeds of 154 to 177 km/h. Such wind speeds can uproot shallow rooted trees and cause extensive damage to building roofing and siding.

## 4. SUMMARY

The Johnny Mountain meteorological station continued to operate in 2020. Data presented in this report are from August 2016 to October 2020.

During the monitoring period of August 2016 to October 2020, the average air temperature was 0.8°C and ranged from 24.8°C (July 31, 2020) to -26.8°C (February 2, 2019). The coldest month is February (-8.1°C) and the warmest is July (9.6°C). The mean relative humidity records indicate that fog and low clouds were present at the Johnny Mountain plateau approximately 36% of the time during the reporting period. The monthly average total precipitation ranged from 86 mm in April to 237 mm in November. The snowpack reached its maximum depth in late March to late April. The maximum daily snowpack (220 cm) was recorded on March 16, 2020. The ground at the meteorological station became snow free each year between mid May and early June. Snow cover on the plateau was variable due to strong winds that redistribute the snow.

Winds were predominately from the southwest quadrant with a secondary predominant direction from the northeast. The highest wind speeds generally blew from northeast during wintertime. The average wind speed was 4 m/s while most frequent speeds were between 3 and 5 m/s (33%). The maximum wind gust speed was 45.1 m/s (162 km/h; January 15, 2020). The hourly average solar radiation ranged from 0 to 990 W/m<sup>2</sup>, peaking during the summer
